Outline

- Fundamentals of ultrasound
- Focusing in ultrasound
- Ultrasonic blood flow estimation
- Nonlinear ultrasonics

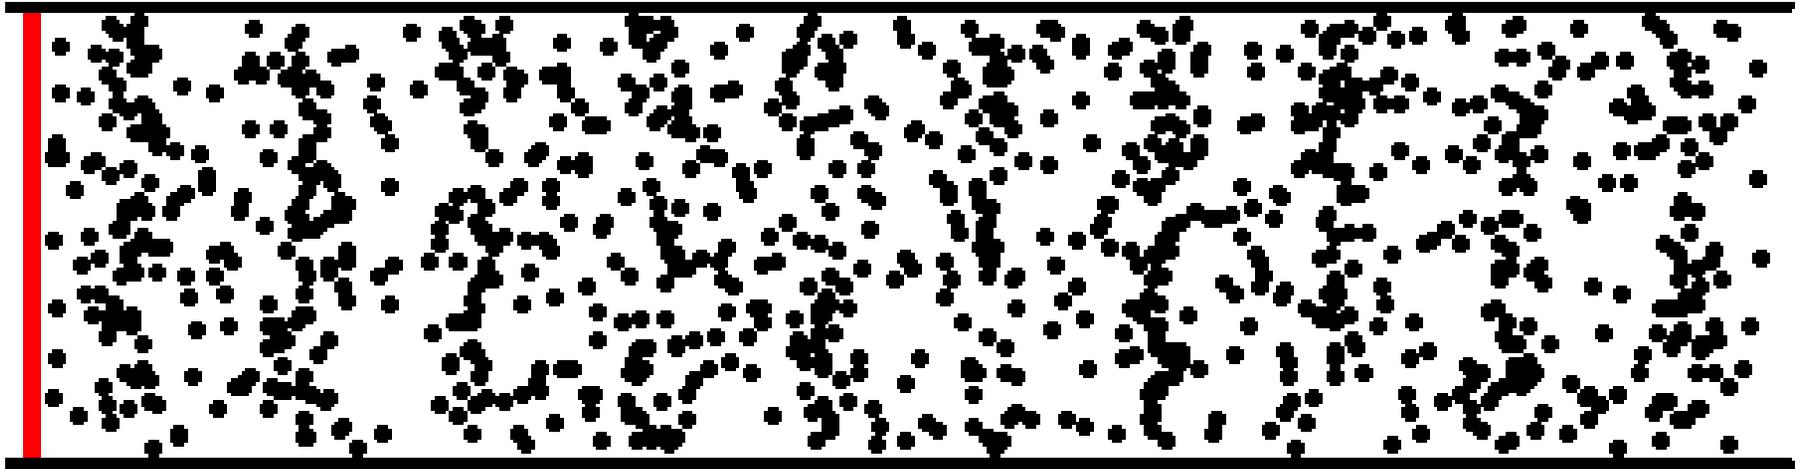

What is ultrasound?

Characteristics of Ultrasound

- A mechanical wave:
 - Characterized by pressure, particle velocity and displacement.
 - Density change of the propagating medium.
 - But it is still a wave, i.e., there is reflection, refraction, scattering, diffraction, attenuation...etc.

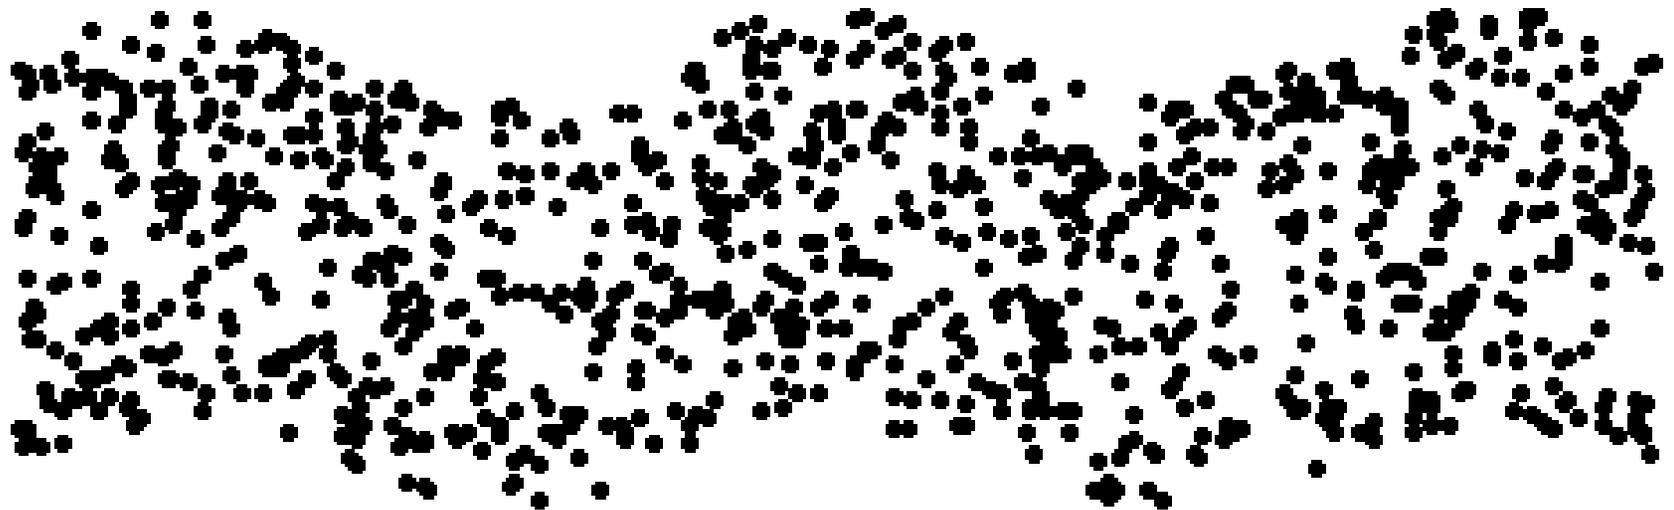

Basics of Acoustic Waves

- Longitudinal Wave:

Basics of Acoustic Waves

- Shear Wave:

Characteristics of Ultrasound

- A mechanical wave:
 - Characterized by pressure, particle velocity and displacement.
 - Density change of the propagating medium.
 - But it is still a wave, i.e., there is reflection, refraction, scattering, diffraction, attenuation...etc.

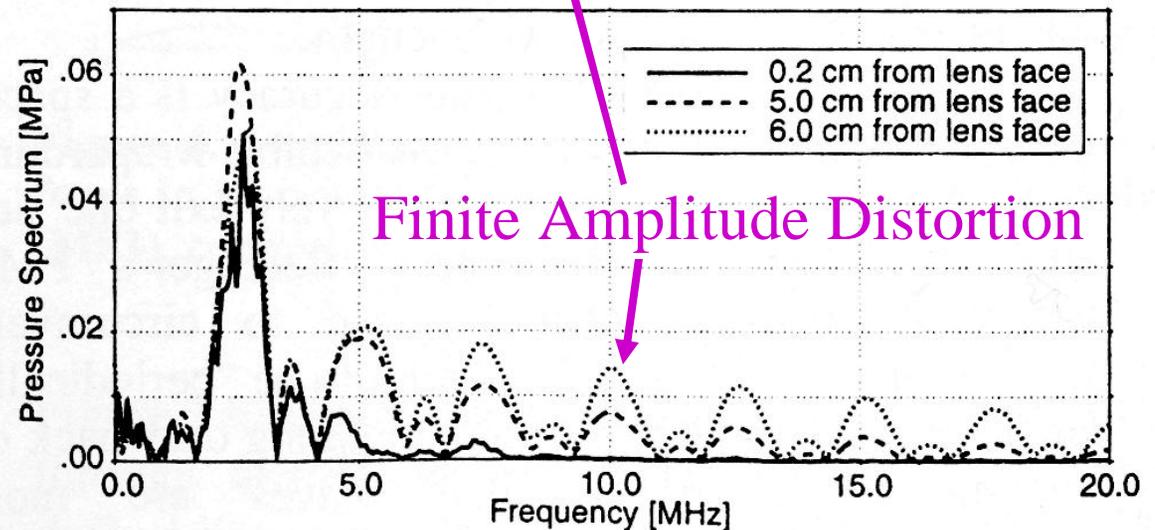

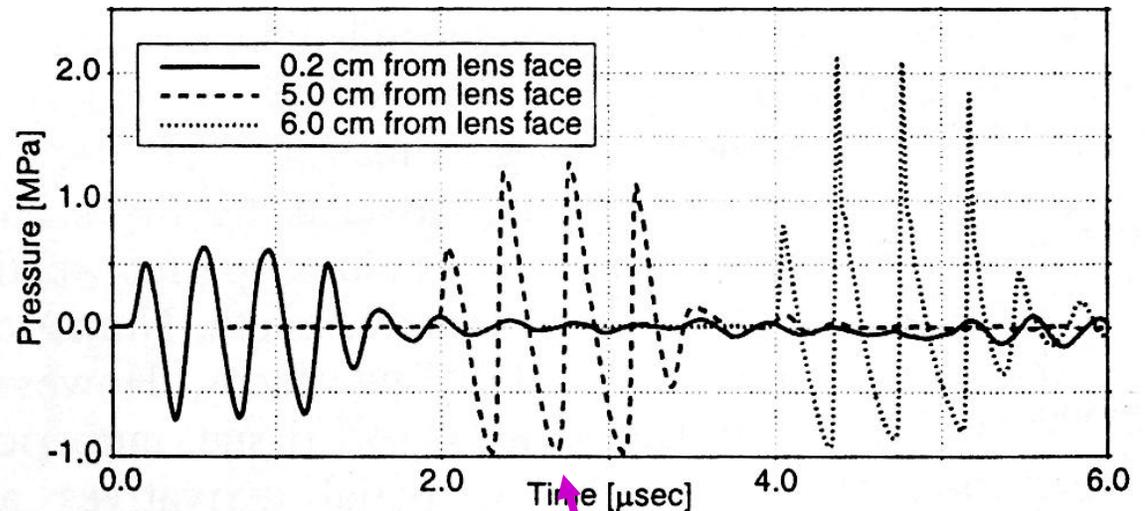

Sound Velocity and Density Change

$$v(x) = c_0 + \left(1 + \frac{B}{2A}\right)u(x)$$

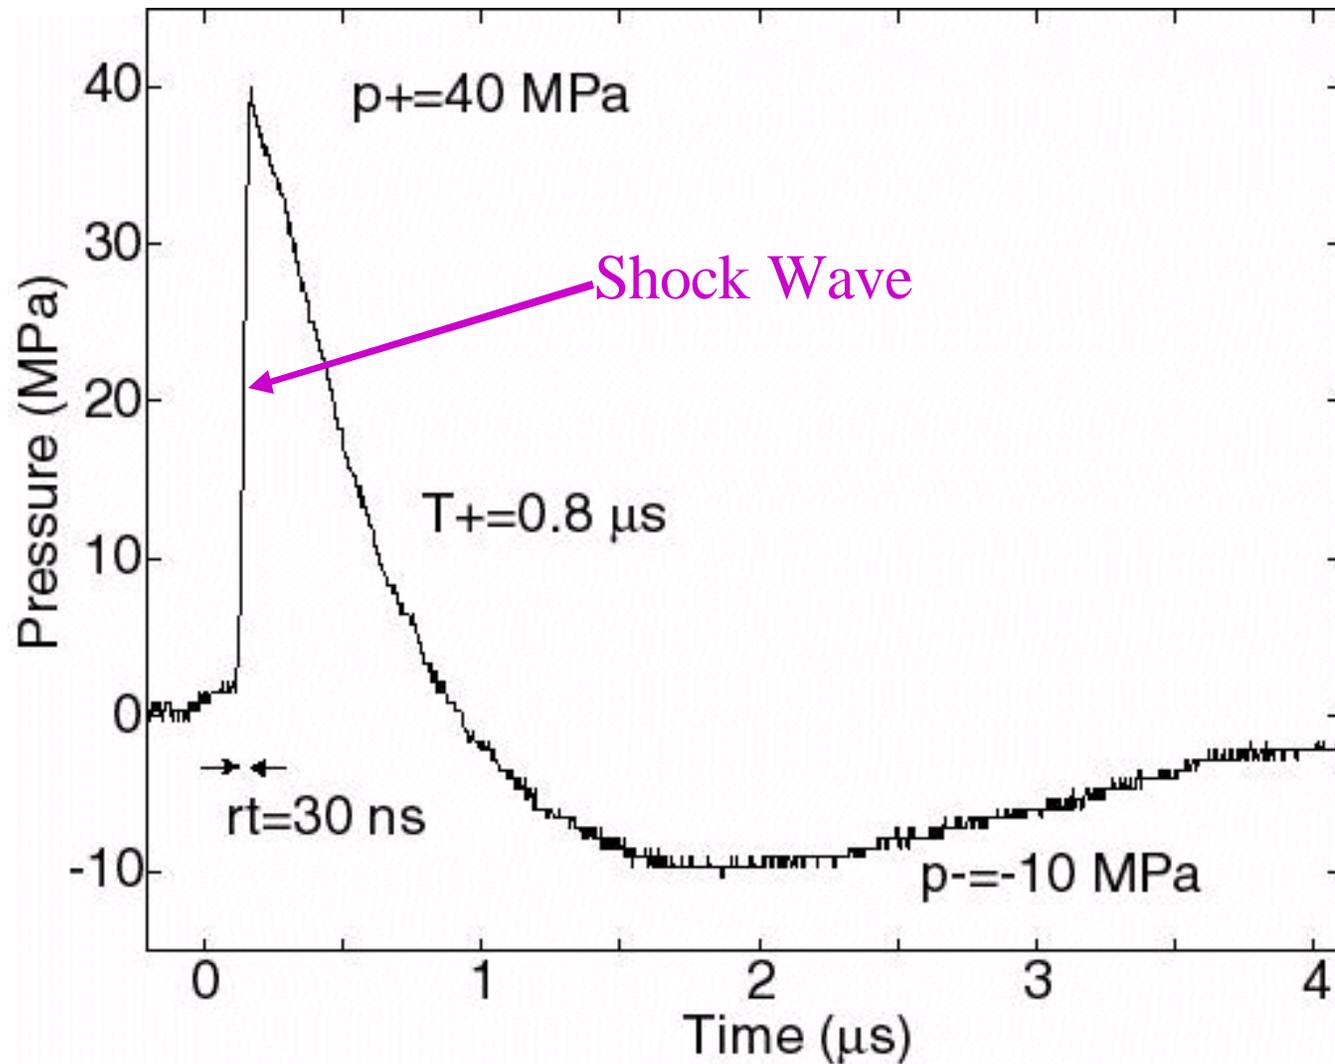

Phase velocity

Nonlinearity

Particle velocity

When Peak Pressure Is Very High

Characteristics of Ultrasound

- A mechanical wave:
 - Characterized by pressure, particle velocity and displacement.
 - Density change of the propagating medium.
 - But it is still a wave, i.e., there is reflection, refraction, scattering, diffraction, attenuation...etc.

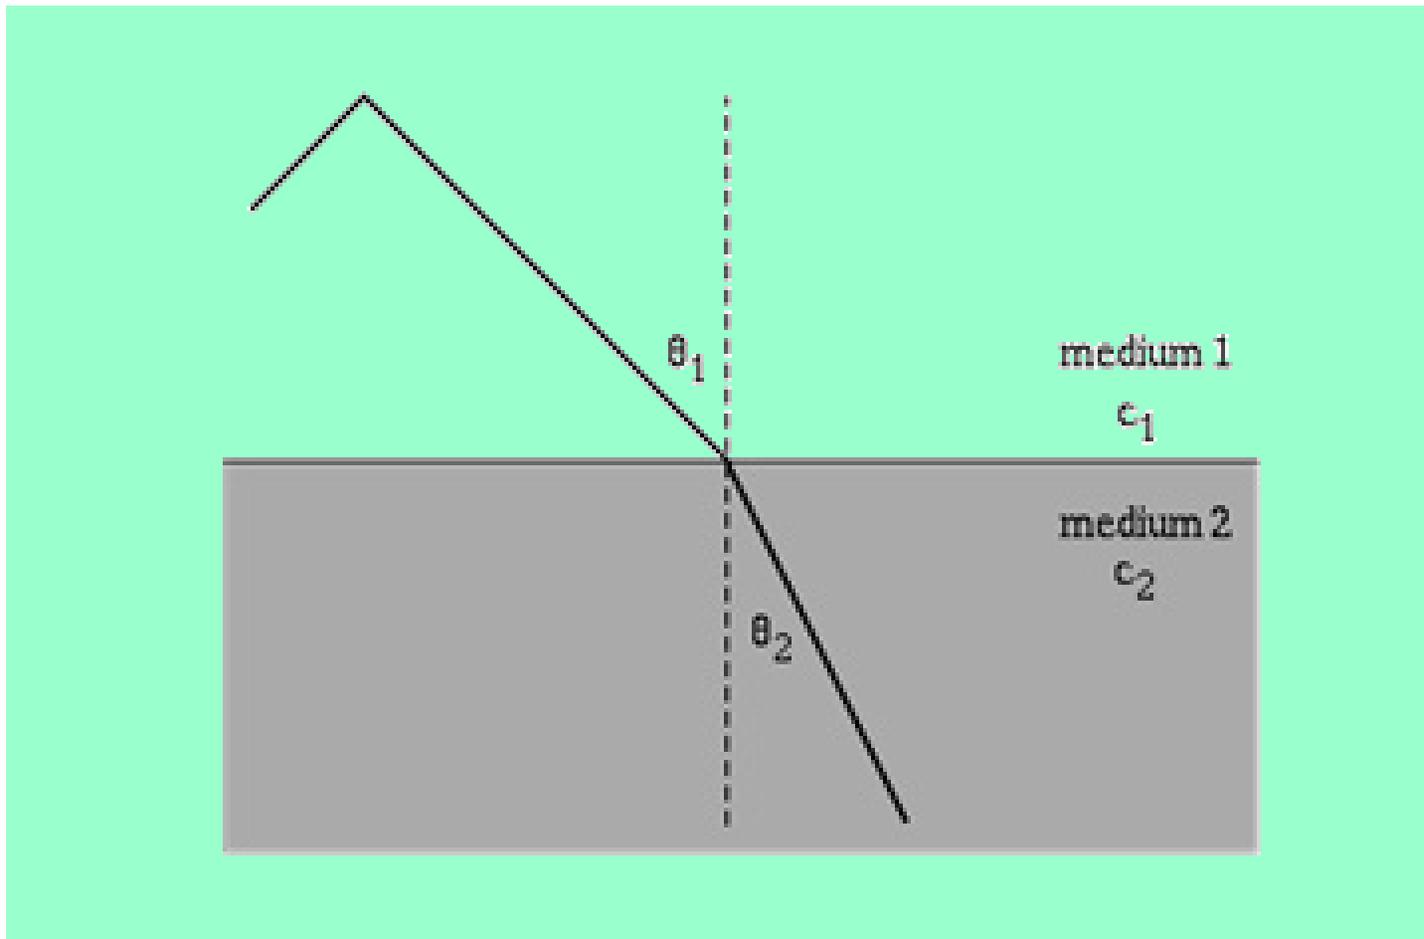

Reflection

Low Density to High Density

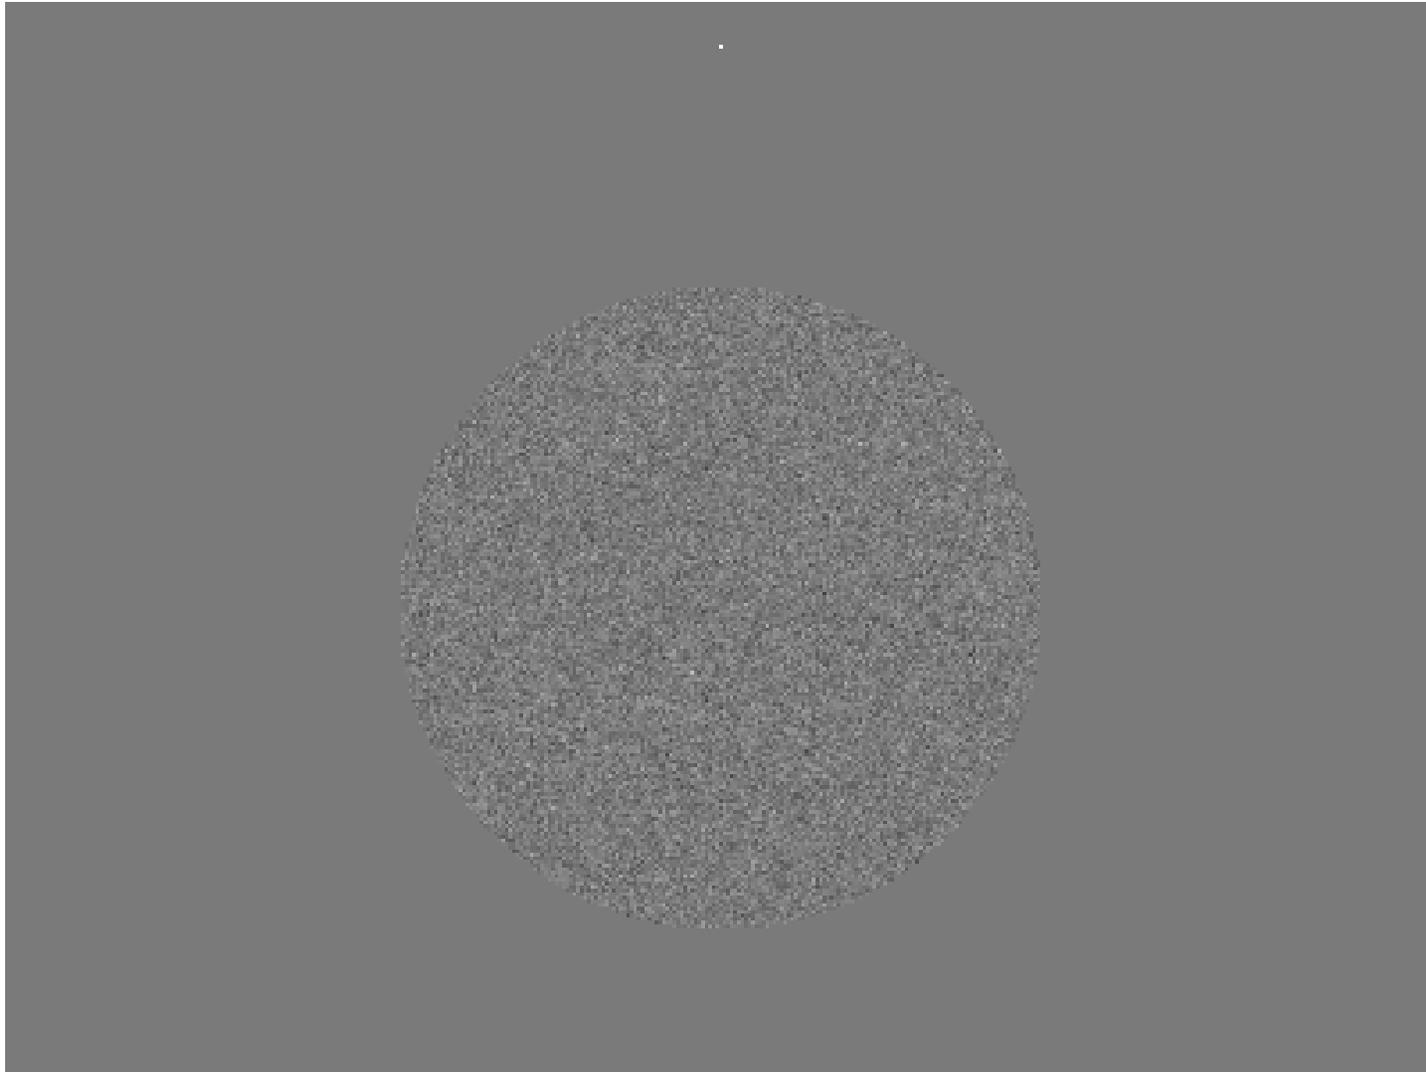

High Density to Low Density

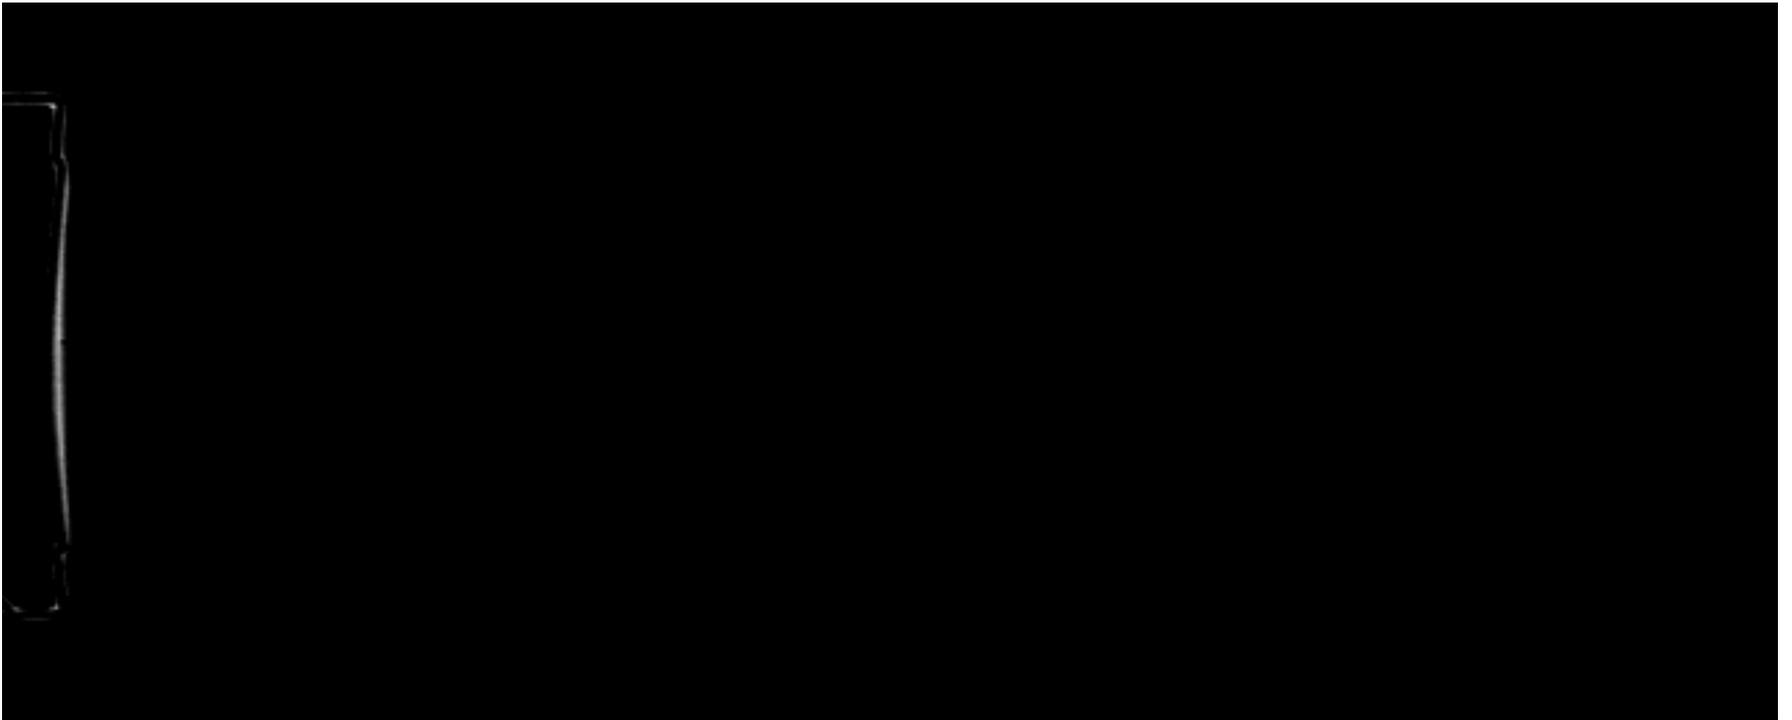

Refraction

Acoustic Scattering

Diffraction

Characteristics of Ultrasound

- Sound wave with frequencies higher than the audible range (>20-25kHz):
 - Typical frequency range for biomedical applications: 0.1-50MHz.
 - $c=f \cdot \lambda$.
 - Sound (propagation) speed in soft tissues are around 1500m/sec. It becomes higher in hard tissues (e.g., bone).

Table IV

Velocity and acoustic impedance of pertinent materials and biological tissues at room temperature (20–25°C)

	Velocity (m/sec)	Impedance $\times 10^{-6}$ (kg/m ² -sec) ^a
Water	1484	1.48
Aluminum	6420	17.00
Air	343	0.0004
Plexiglas	2670	3.20
Blood	1550	1.61
Myocardium (perpendicular to fibers)	1550	1.62
Fat	1450	1.38
Liver	1570	1.65
Kidney	1560	1.62
Skull bone	3360 (longitudinal)	6.00

^aRayl is a unit commonly used for acoustic impedance. One rayl = 1 kg/m²-sec.

Characteristics of Ultrasound

- Affected by the elastic properties of the propagating medium:
 - Various modes of propagation.
 - Hooke's law: $T = eS$ (tensor form in 3D).

$$c = \sqrt{B / \rho}$$

Characteristic impedance : $Z_0 = \rho c$

TABLE 9.3

REFLECTIVITY OF NORMALLY INCIDENT WAVES

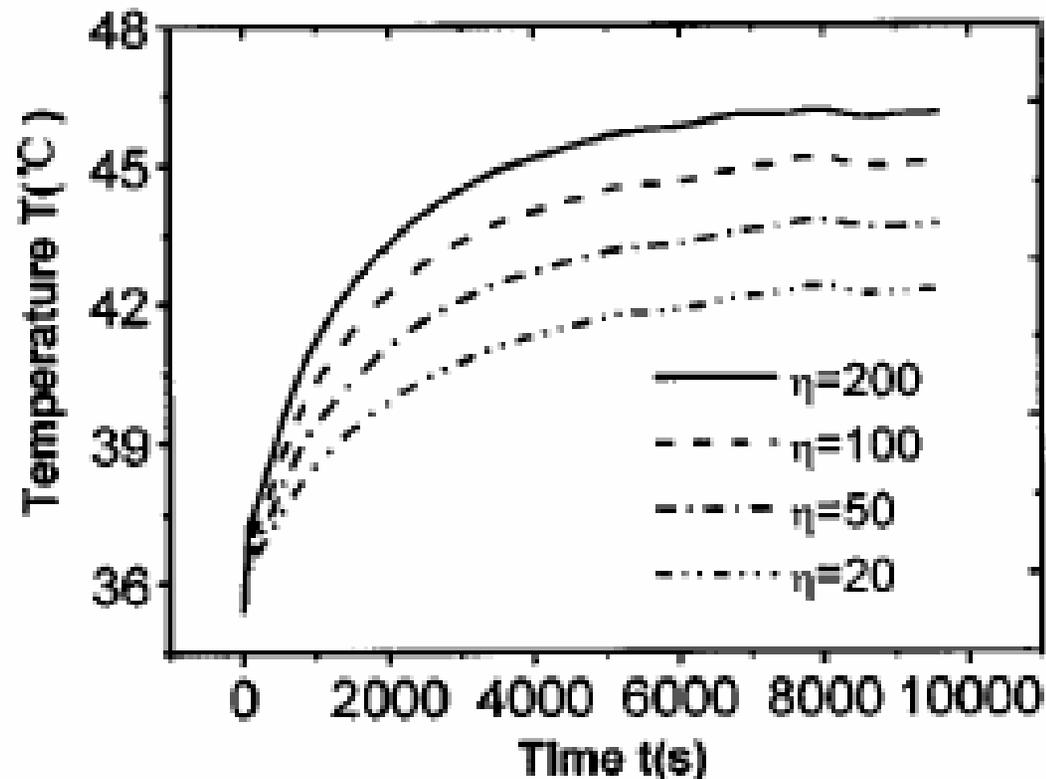

Materials at Interface	Reflectivity
Brain-skull bone	0.66
Fat-bone	0.69
Fat-blood	0.08
Fat-kidney	0.08
Fat-muscle	0.10
Fat-liver	0.09
Lens-aqueous humor	0.10
Lens-vitreous humor	0.09
Muscle-blood	0.03
Muscle-kidney	0.03
Muscle-liver	0.01
Soft tissue (mean value)-water	0.05
Soft tissue-air	0.9995
Soft tissue-PZT5 crystal	0.89

Bio-Effects

- Heating
- Cavitation

Ultrasound Heating

- Bio-transfer equation: $\rho c \frac{\partial T}{\partial t} = k \frac{\partial^2 T}{\partial x^2} + \omega_b \rho_b c_b (T_a - T) + Q_m + Q_r(x, t)$

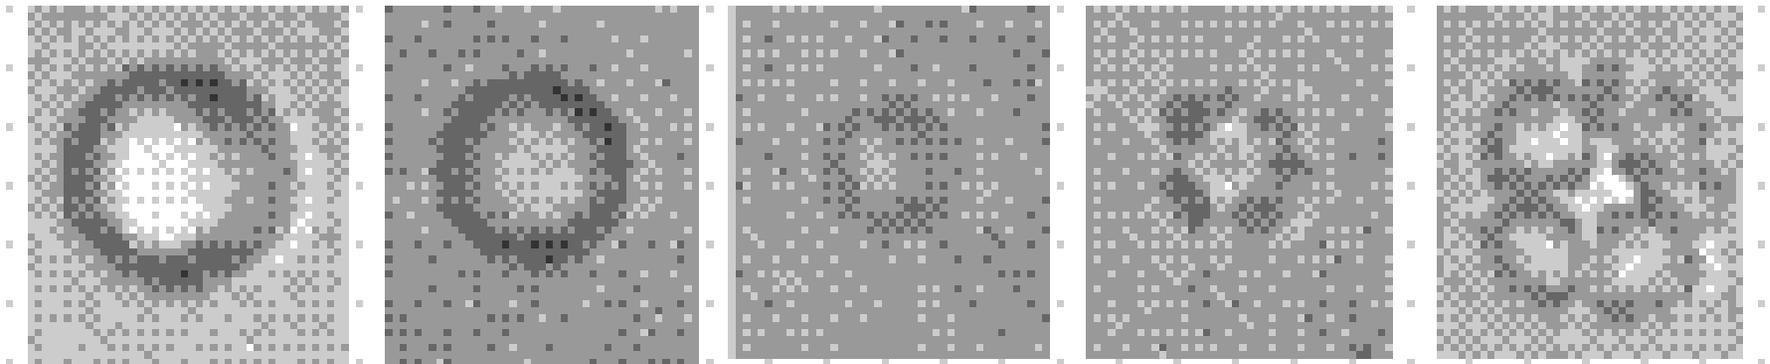

Bio-Effects

- Heating
- Cavitation

Cavitation

- Formation and behavior of gas bubbles in acoustic fields.
- Transient cavitation: sudden growth and collapse of bubbles, resulting shock waves and very high temperatures.

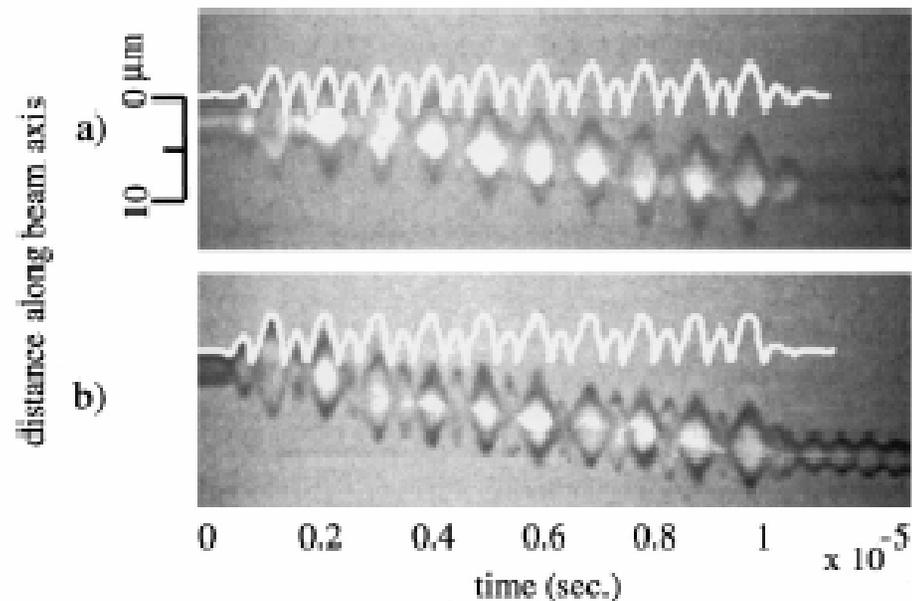

Other Acoustic Phenomena

- Radiation force.
- Sonoluminescence.
- ...etc.

Radiation Force

- An ultrasonic wave exerts a static force on an interface or in a medium where there is a decrease in power in the wave propagation direction.

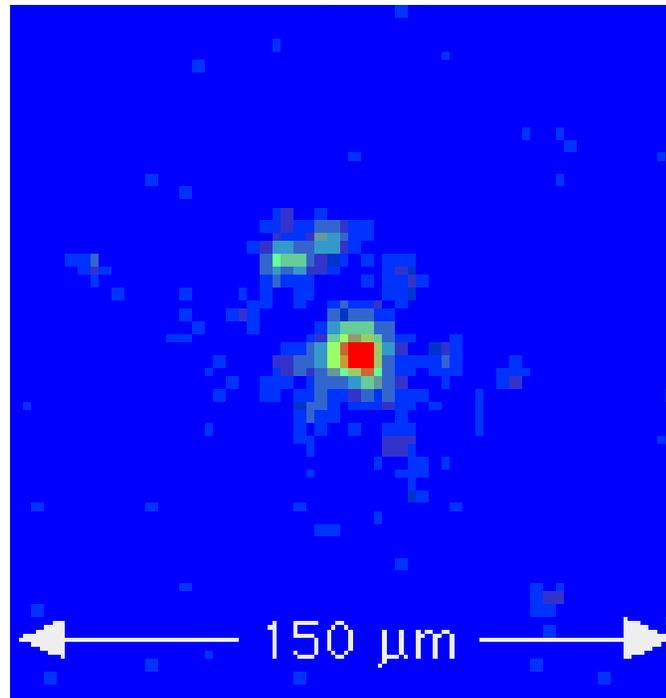

Other Acoustic Phenomena

- Radiation force.
- Sonoluminescence.
- ...etc.

Sonoluminescence

- Weak emission of light observable when high intensity ultrasound passing through a medium containing dissolved gases.

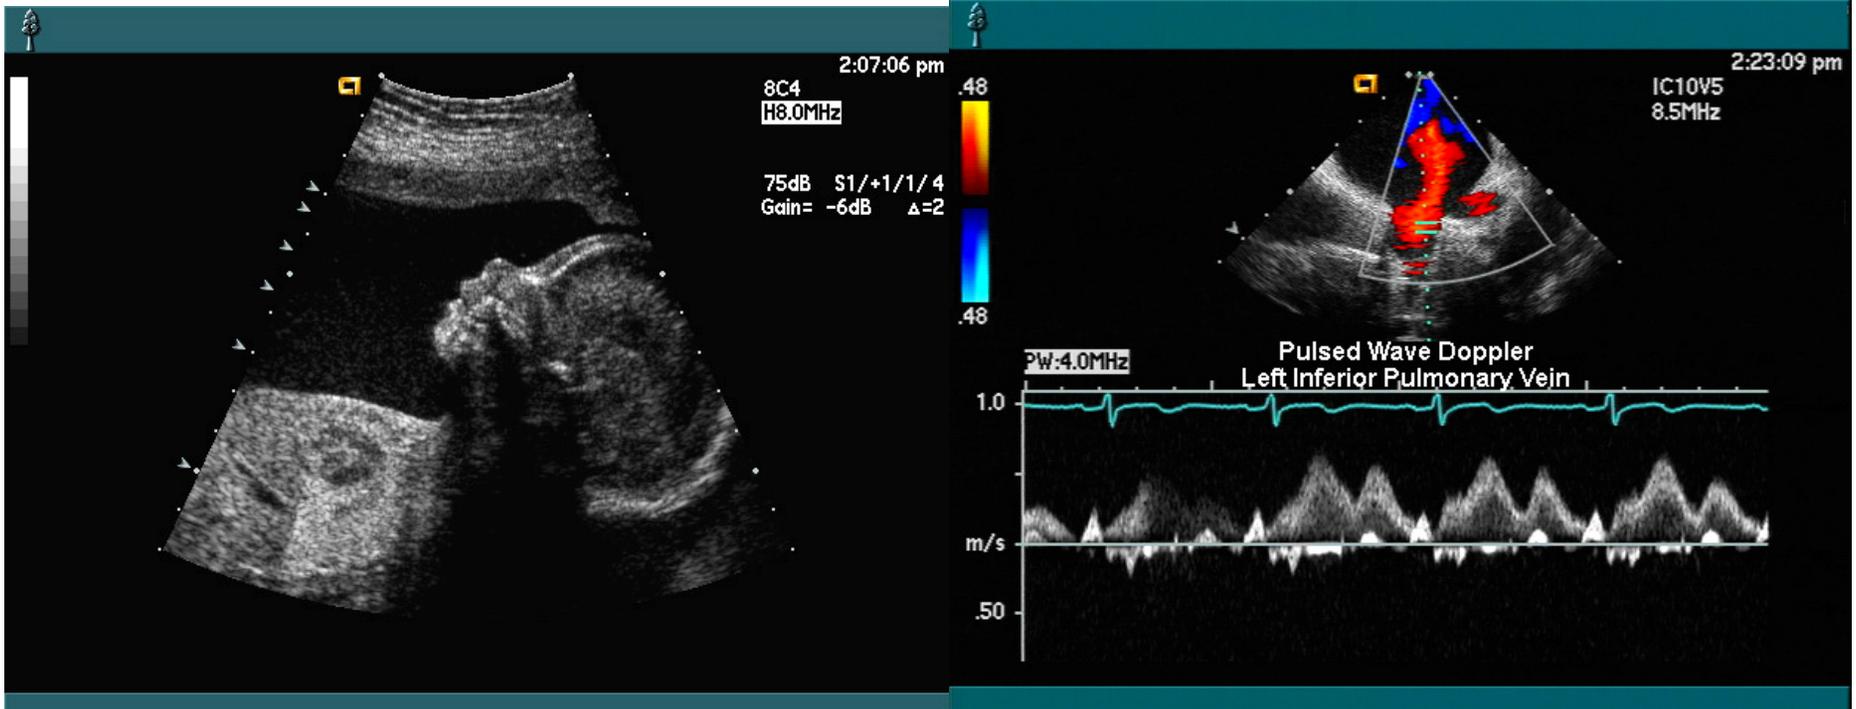

...,etc.

What can ultrasound do in
medicine and biology?

Ultrasound in Medicine and Biology

- Diagnostics (as a wave):
 - Imaging.
 - Blood flow measurements.
 - Bone density (indirect).
 - ...etc.

Ultrasonic Imaging

Ultrasound in Medicine and Biology

- Therapeutics:
 - Heat generation:
 - Hyperthermia.
 - HIFU.
 - Shock wave
 - Lithotripsy.
 - ...etc.

Hyperthermia

- Hyperthermia is a method of treating cancerous tissue by elevating the tissue temperature to 42.5 °C or above, and maintaining this for 30-60 minutes.

Hyperthermia

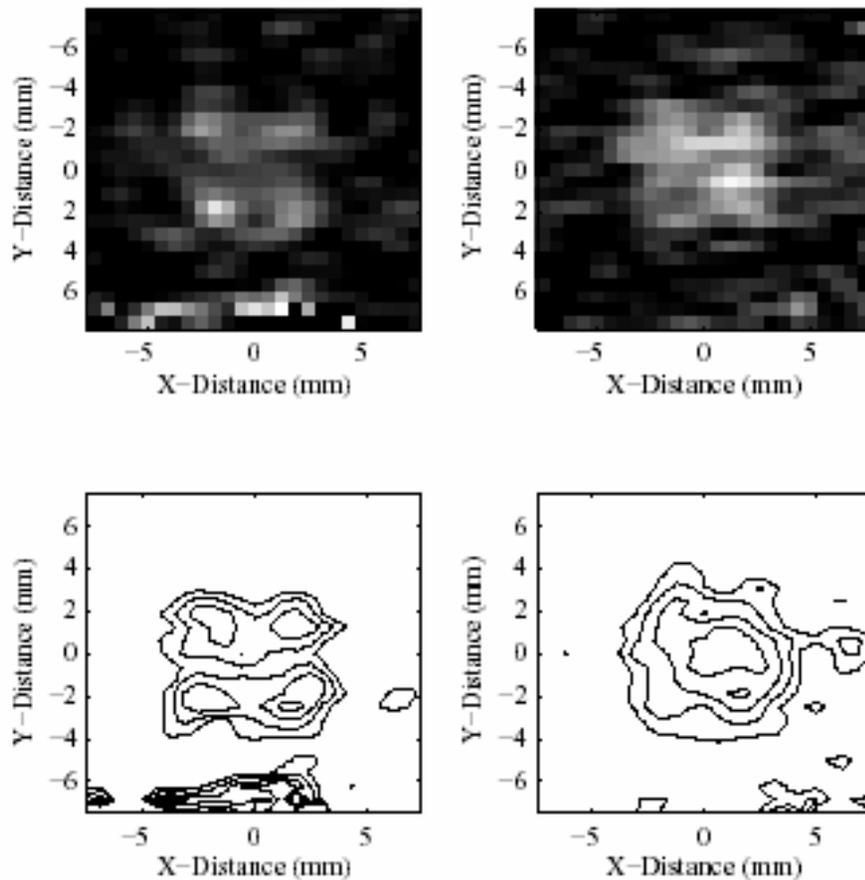

Figure 3: Thermal contour images for (left) non-switched and (right) switched sonications.

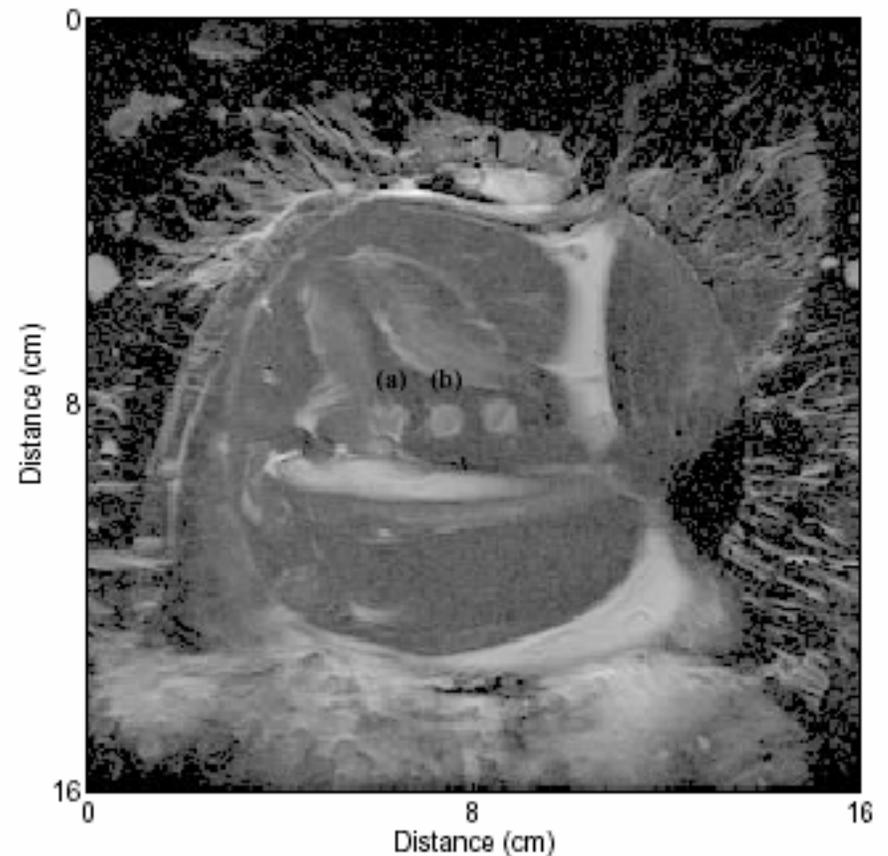

Figure 4: T2 weighted image of thermal necrosis caused by (a) single four focus pattern and (b) switched focus pattern across axis.

HIFU

- *High Intensity Focused Ultrasound.*
- In the focal point, the sudden and intense absorption of the ultrasound beam creates a sudden elevation of the temperature (from 85 to 100 °C) which destroys the cells located in the targeted zone.

HIFU for Prostate Cancer

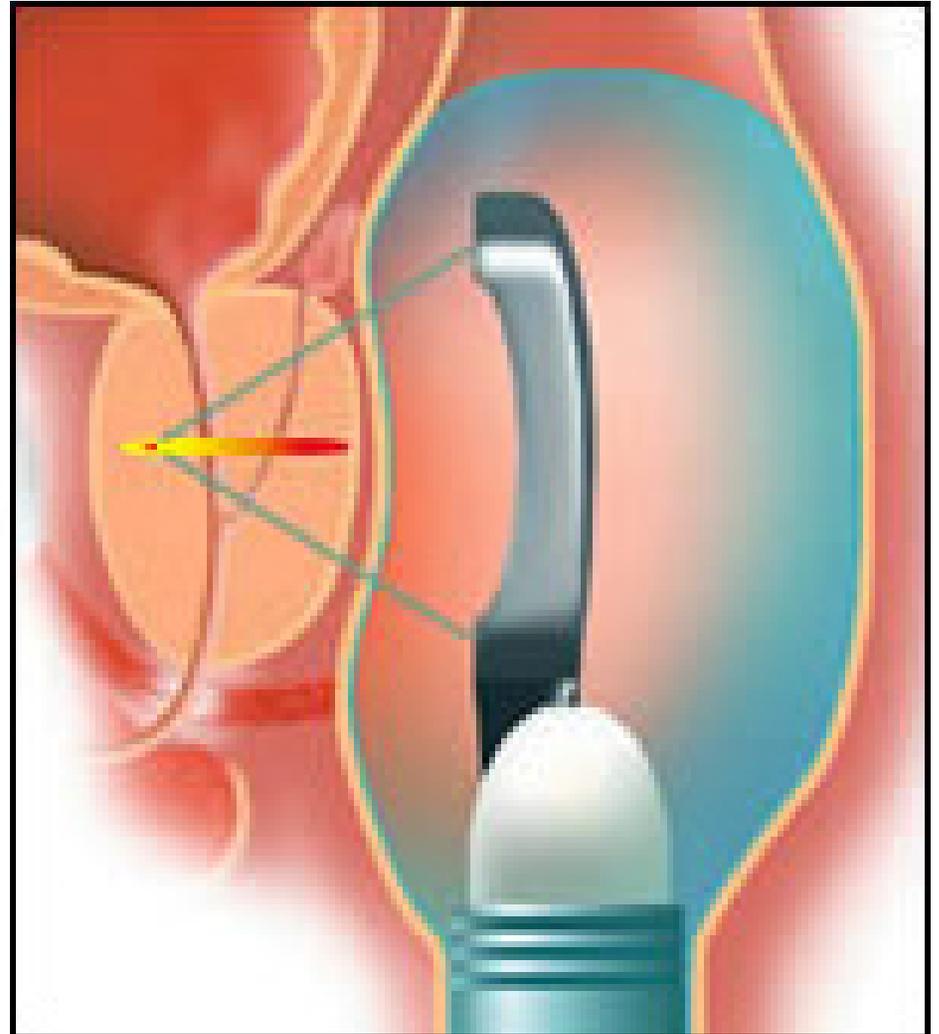

Image Guided HIFU

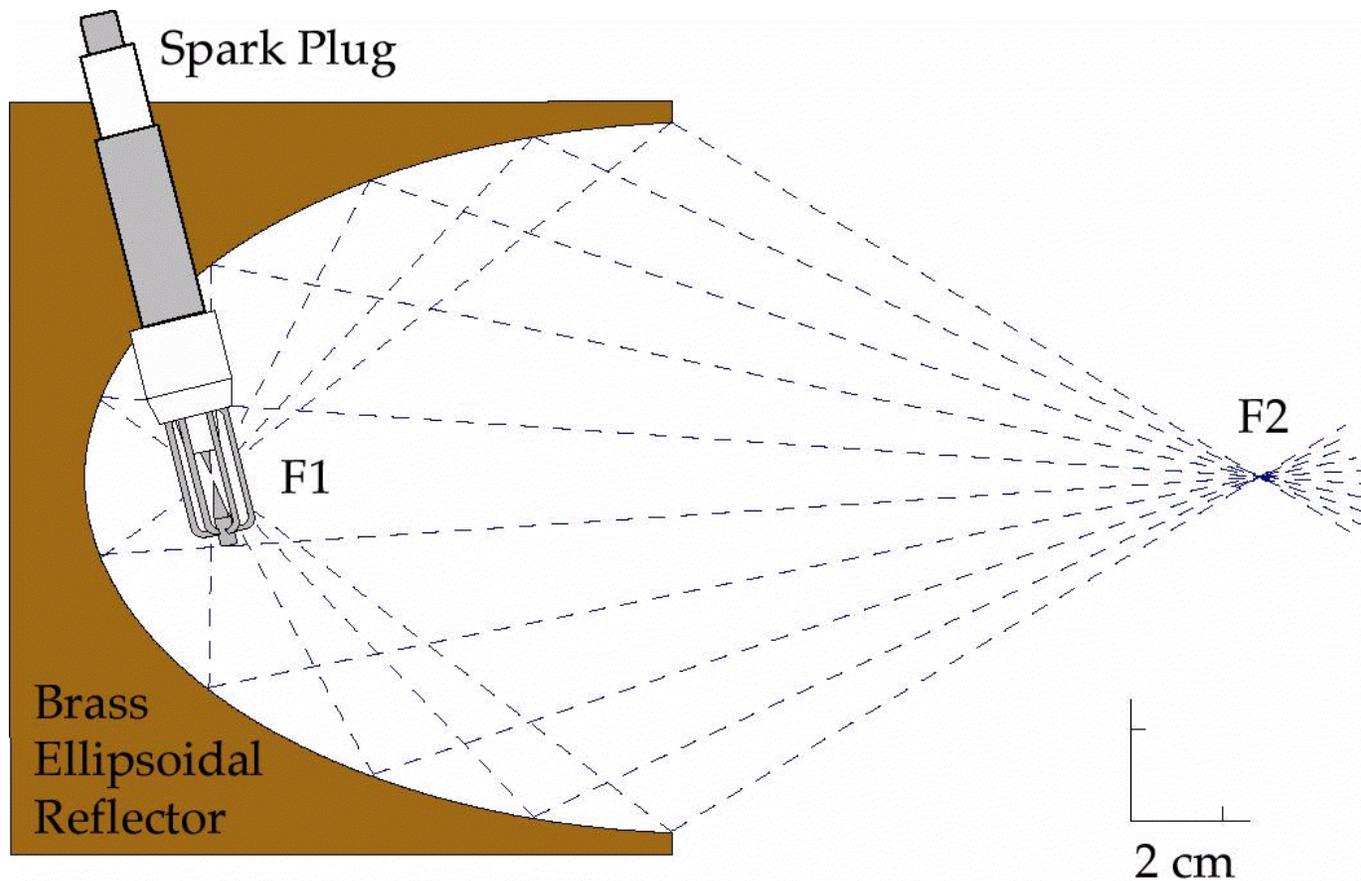

Ultrasound in Medicine and Biology

- Therapeutics:
 - Heat generation:
 - Hyperthermia.
 - HIFU.
 - Shock wave
 - Lithotripsy.
 - ...etc.

Extracorporeal Lithotripsy

- The use of shock waves to destroy stones in the body.

Extracorporeal Lithotripsy

Ultrasound in Medicine and Biology

- Sonoluminescence.
- Radiation force.
- Cavitation.
- Cosmetics.
- ...etc.

Bio-Effects and Safety Requirements

Basics

- Safety regulations.
- Physical parameters vs. Bio-effects.
- Measurement techniques.
- Dose: Energy absorption in tissue.
 - Temperature rise, cell damage.
 - Dosimetry: measurements of such effects.
- Exposure: Characteristics of ultrasound field.
 - Pressure, intensity, power.
 - Exposimetry: measurements of temporal/spatial characteristics.

Bio-Effects

- Temperature rise and cell damage (cavitation).
- FDA Track I: Pre-amendments.
 - I_{SPTA} (720 mW/cm²) and I_{SPPA} (190 W/cm²).
- FDA Track III:
- ALARA (as low as reasonably achievable).

Bio-Effects

- Thermal index (TI):
 - TIS, TIB, TIC.
 - Analytical.
- Mechanical Index (MI):
 - Experimental.
 - Destruction of bubble with different sizes at various frequencies.

Clinical Applications

(From www.acuson.com)

- OB/GYN, vascular, cardiac, transcranial, abdominal, musculoskeletal, endo-vaginal, endo-rectal, ocular, intra-vascular, ...etc.

Characteristics of Diagnostic Ultrasound

- Non-invasive.
- Safe (under regulations).
- Real-time.
- Reflection mode (similar to RADAR).
- Blood flow imaging.
- Access.
- Portable.
- Body type dependent.

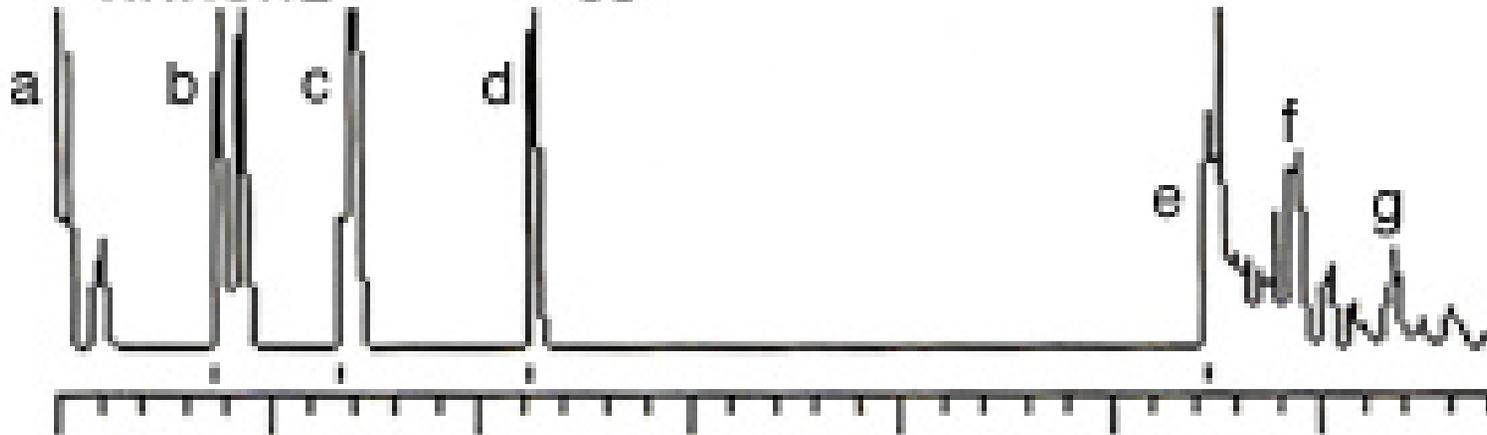

Function Modes

- A-mode (A-scan, 1D).
- B-mode (Gray scale, 2D).
- 3D ultrasound.
- M-mode (motion)
- Color Doppler (2D, blood flow).
- Spectral Doppler (localized, blood flow).
- Audio Doppler.

Linear Scanning

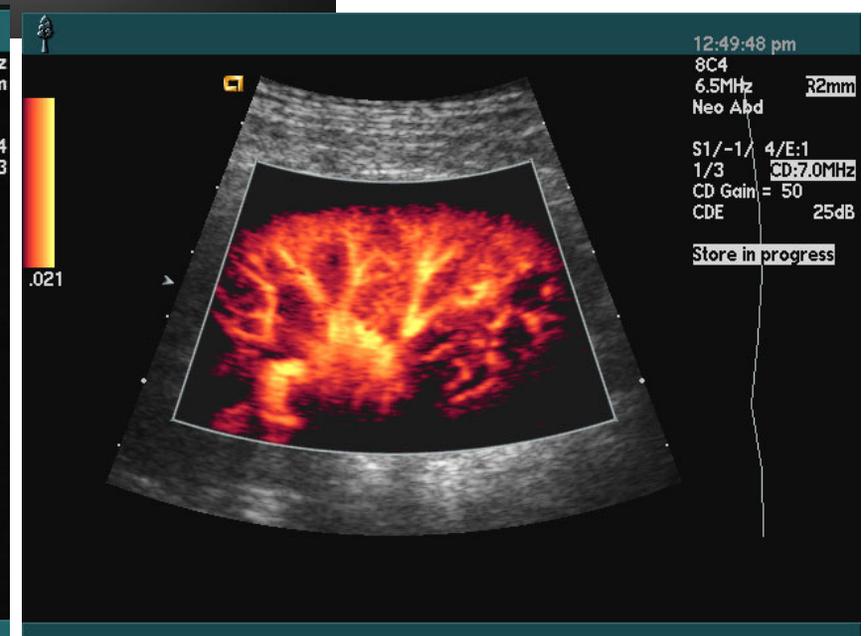

Beam Formation Using Arrays

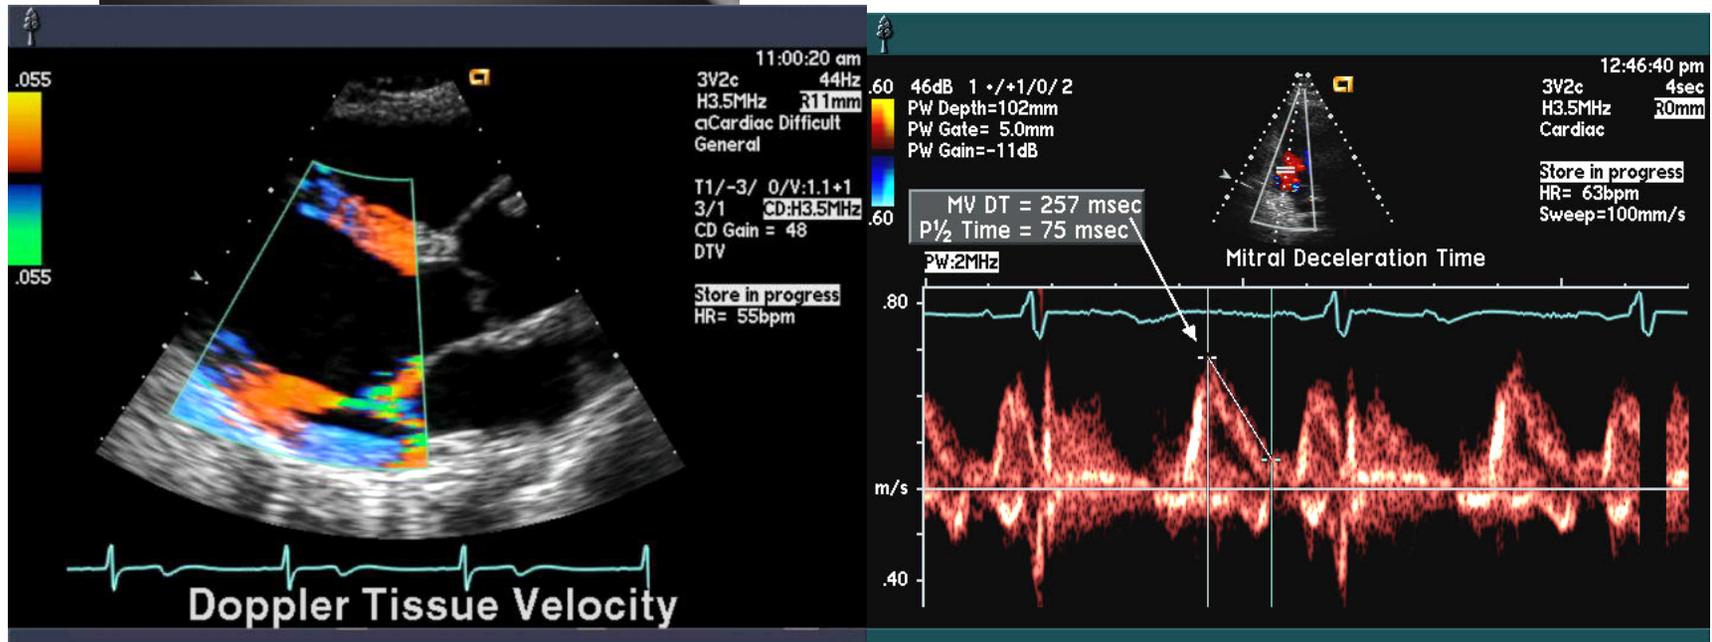

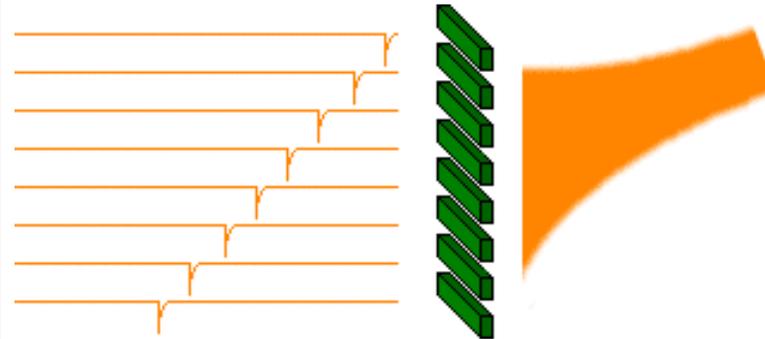

Focusing:

Curved Linear Scanning

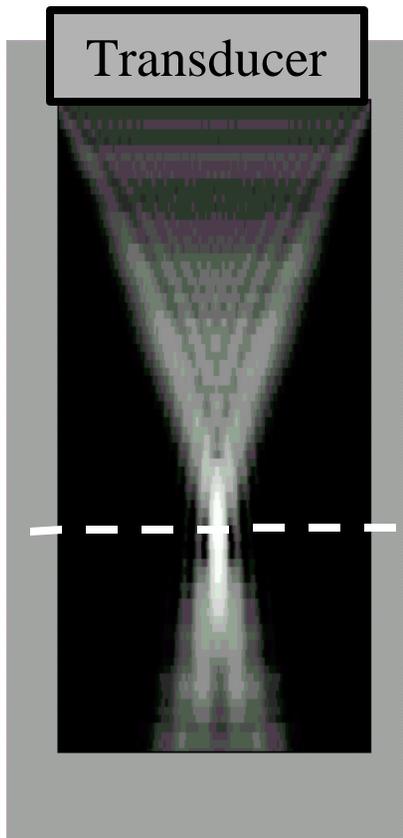

Sector Steering

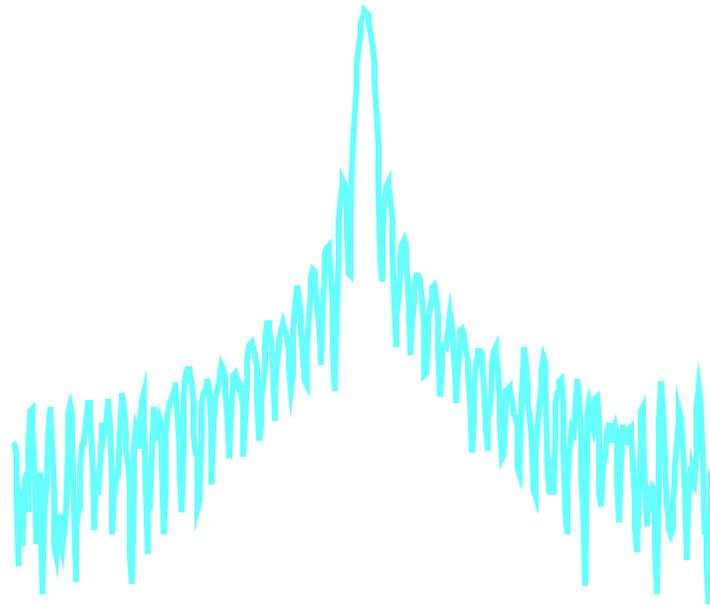

How is the resolution determined?

Focusing \leftrightarrow Beam Formation

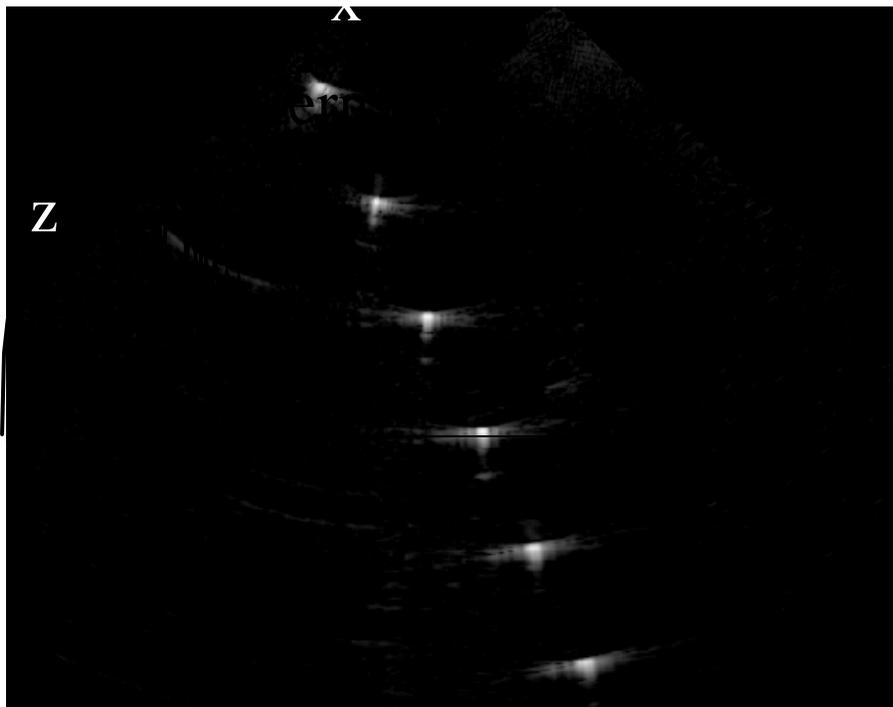

- To form a beam of sound wave such that only the objects along the beam direction are illuminated and possibly detected.

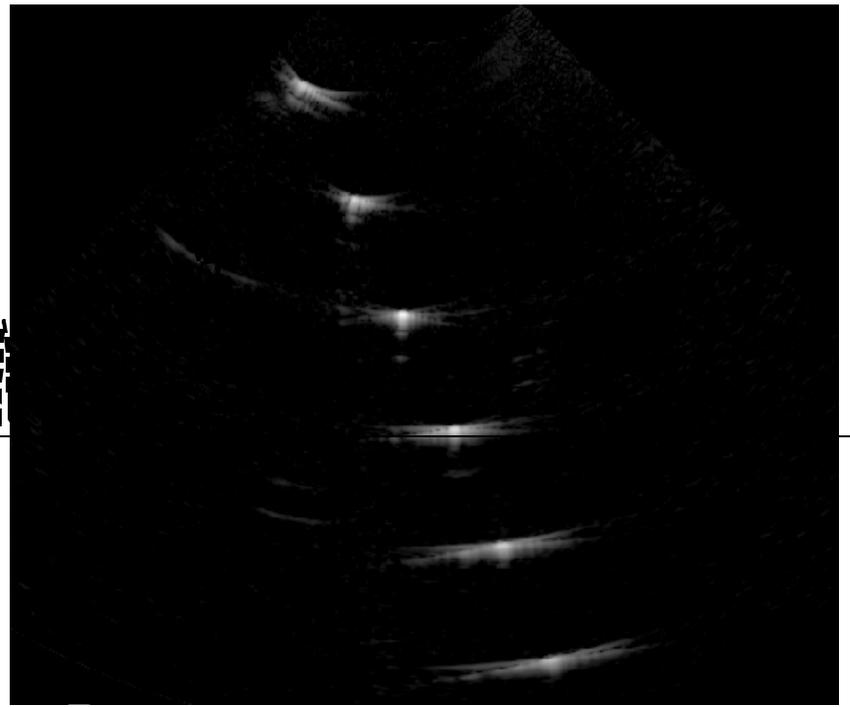

Nomenclature

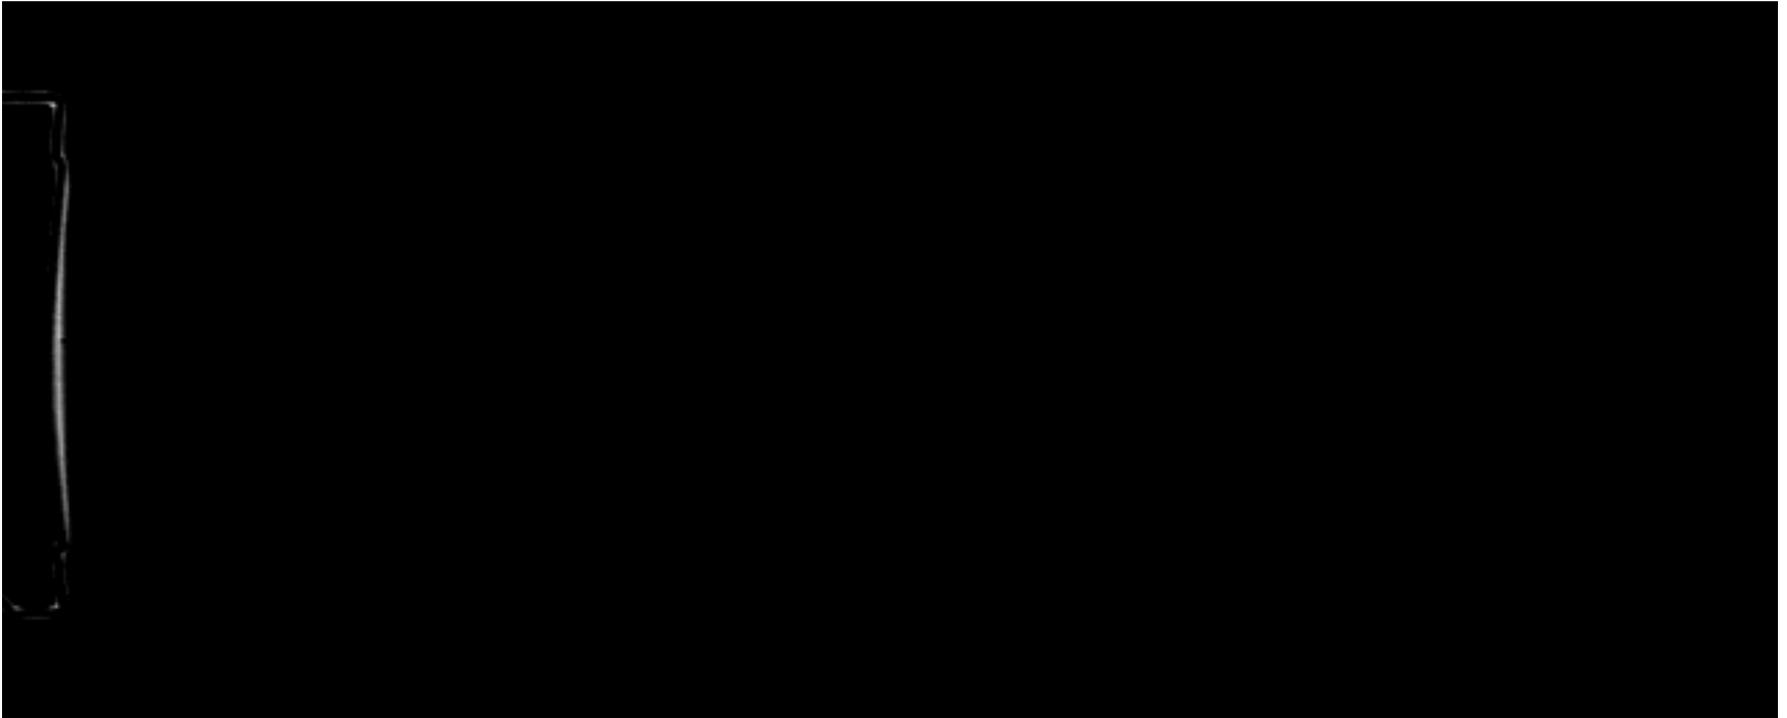

Good Focusing

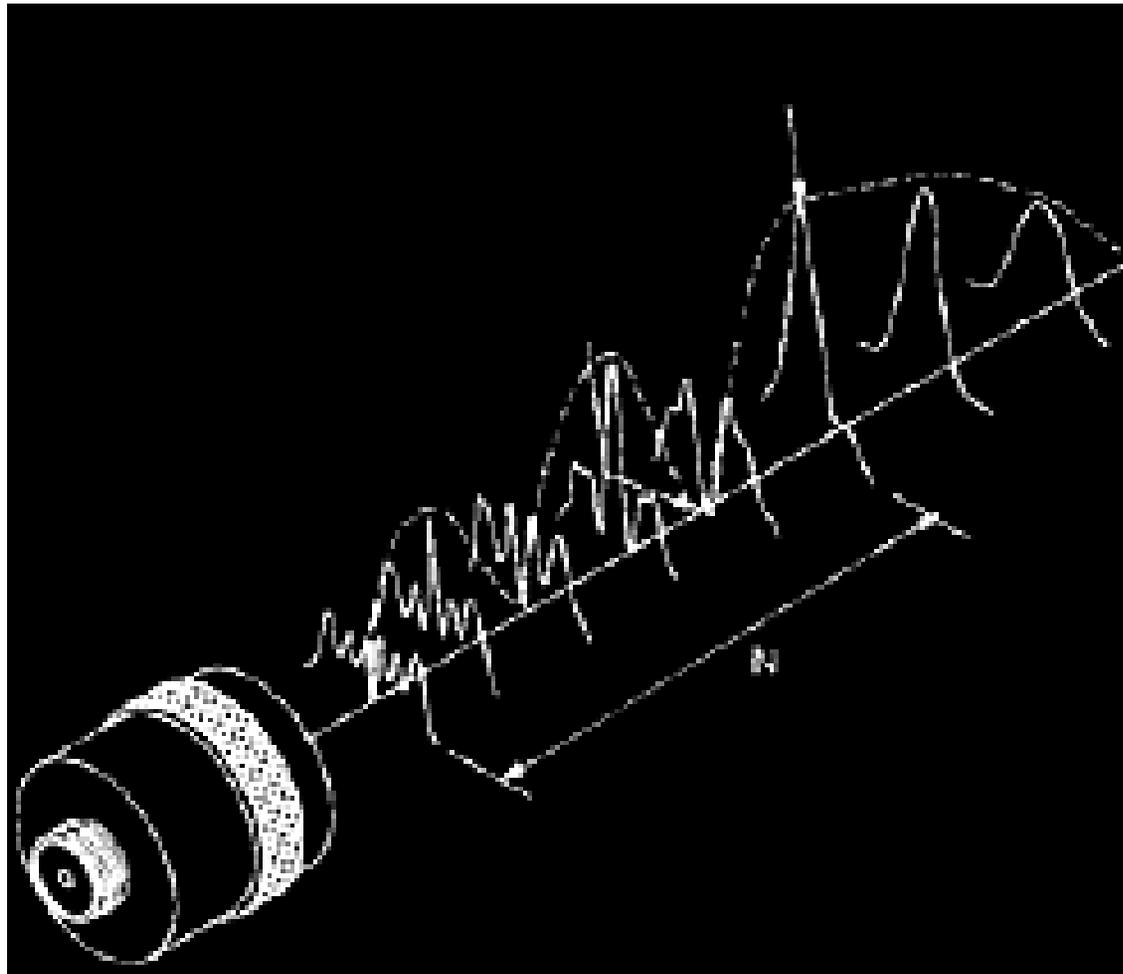

Poor Focusing

Pulsed Wave (PW) vs. Continuous Wave (CW)

Radiation Pattern

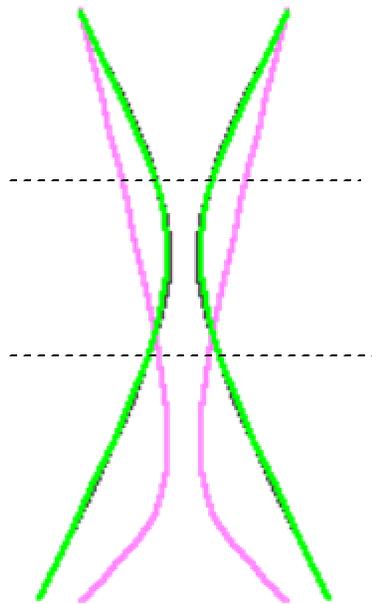

How to focus?

Beamforming

- Manipulation of transmit and receive apertures.
- Trade-off between performance/cost to achieve:
 - Steer and focus the transmit beam.
 - Dynamically steer and focus the receive beam.
 - Provide accurate delay and apodization.
 - Provide dynamic receive control.

Focusing

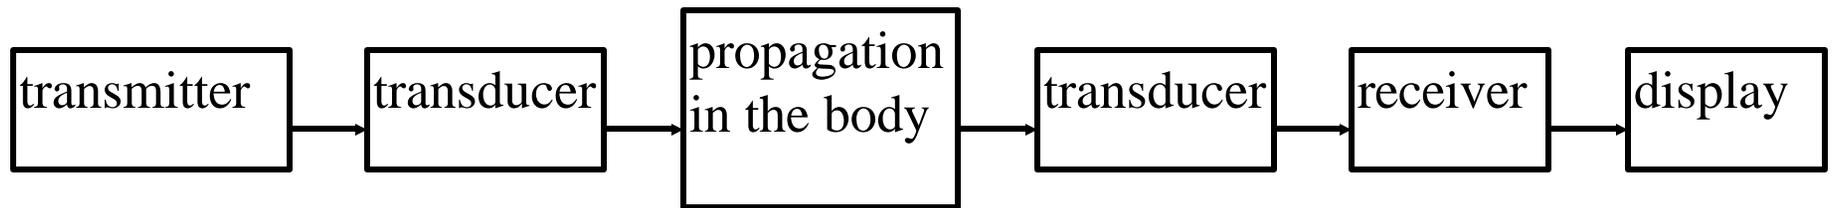

Single Zone Focusing

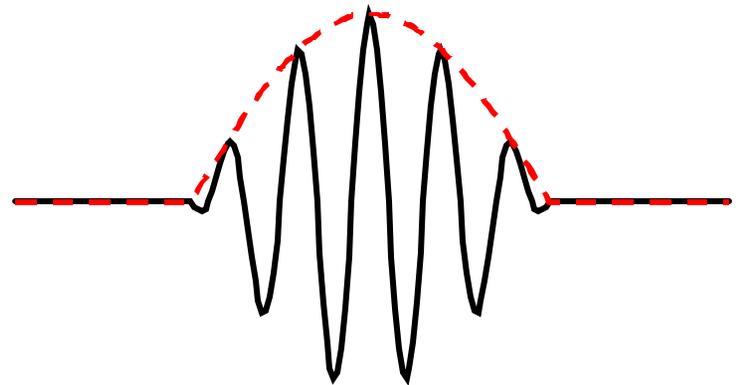

Multi-Zone Focusing

Moiré Pattern

Temporal Resolution (Frame Rate)

- Frame rate = $1/\text{Frame time}$.
- Frame time = number of lines * line time.
- Line time = $(2 * \text{maximum depth}) / \text{sound velocity}$.
- Sound velocity is around 1540 m/s.
- High frame rate is required for real-time imaging.

Temporal Resolution

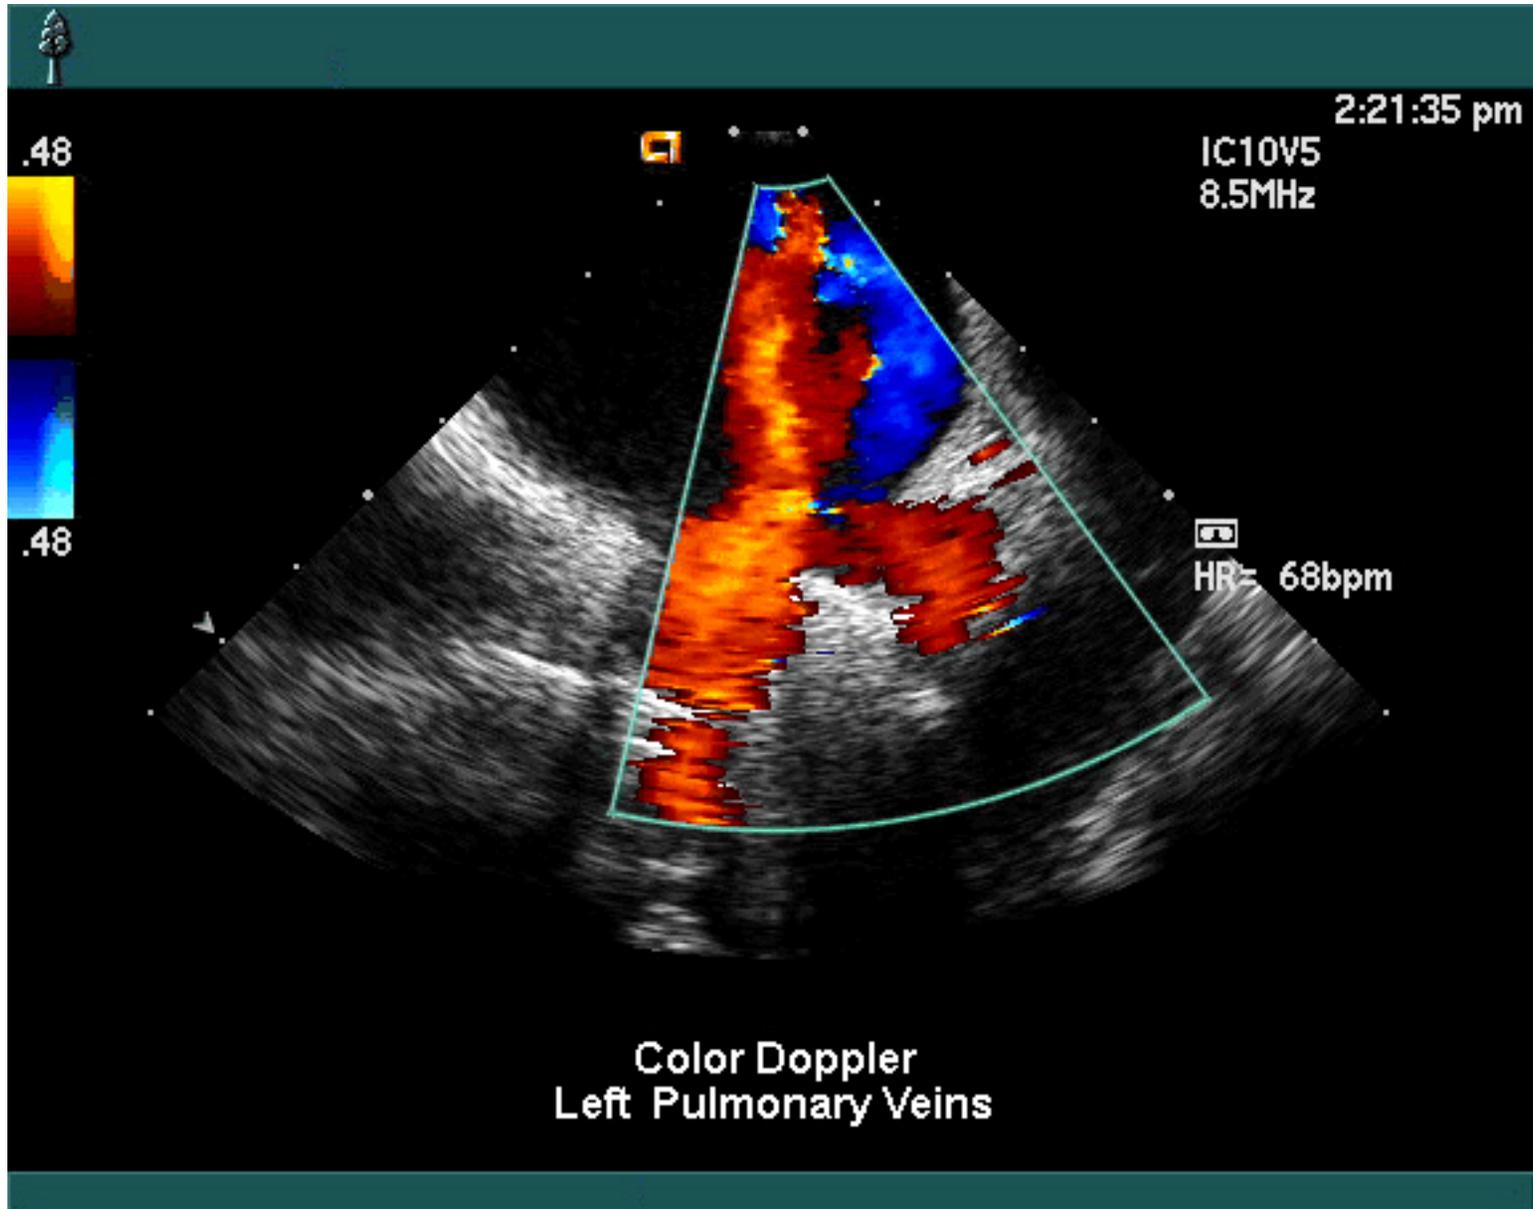

- Display standard: NTSC: 30 Hz. PAL: 25 Hz (2:1 interlace). 24 Hz for movie.
- The actual acoustic frame rate may be higher or lower. But should be high enough to have minimal flickering.
- Essence of real-time imaging: direct interaction.

Temporal Resolution

- For an actual frame rate lower than 30 Hz, interpolation is used.
- For an actual frame rate higher than 30 Hz, information can be displayed during playback.
- Even at 30 Hz, it is still possibly undersampling.

Doppler Effect

Doppler Principles

- Relative motion of the source causes a change in received frequency.
- Blood flow velocity is measured by detecting Doppler frequency shifts.

Doppler Equations

$$f_d = f_s \frac{v_r + v_s}{c - v_s}$$

$$f_d \approx f_s \frac{(v_r + v_s)}{c}$$

where f_d is the Doppler frequency shift,

f_s is the carrier frequency,

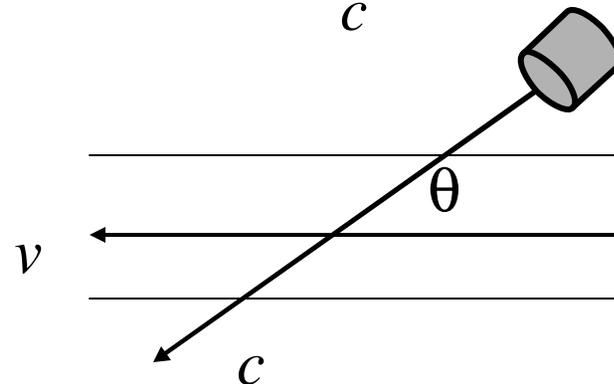

c is the sound velocity in blood,

v_s and v_r are source and receiver velocities.

Doppler Ultrasound

- Primary scattering site: red blood cell. The platelet is too small and the number of leukocytes is not significant.
- The red blood cell size is around several microns. Thus, scattering and speckle are also present.
- The red blood cells in a sample volume are assumed to move in unison.

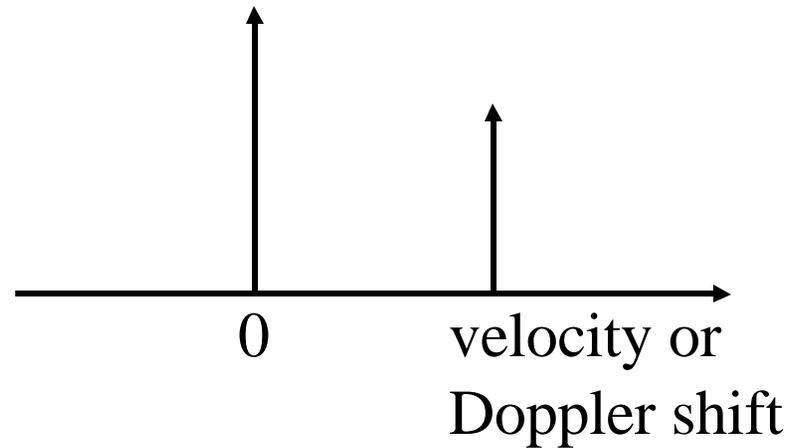

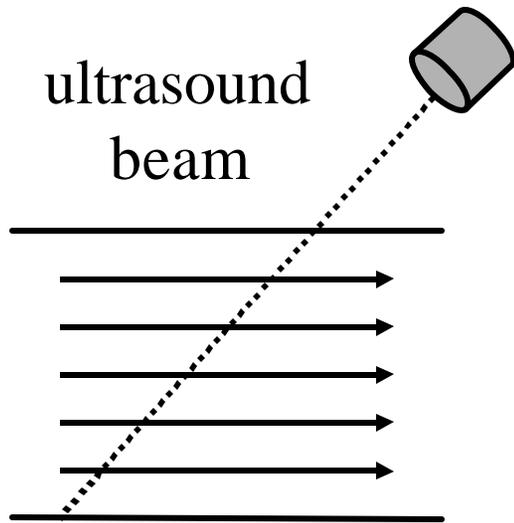

Doppler Equations

$$f_d = \frac{2vf_s}{c} \cos \theta$$

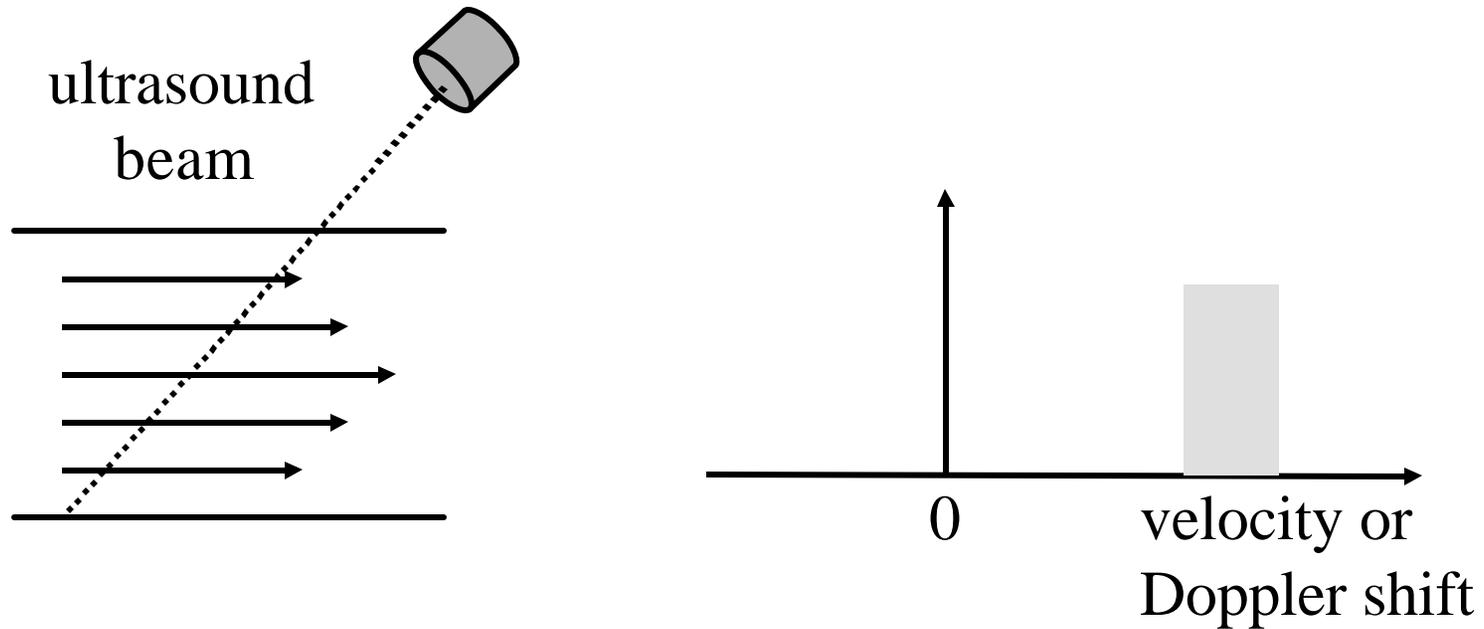

The diagram shows a probe (represented by a grey cylinder) positioned at an angle θ relative to the flow direction. The flow velocity is v , and the sound velocity is c . The probe is emitting and receiving sound waves, which are represented by horizontal lines. The angle θ is the angle between the probe's axis and the flow direction.

- Typical physiological flows (5-10m/sec at most) are much slower than sound velocity in the body ($\sim 1500\text{m/sec}$).
- Doppler shift is doubled due to round-trip propagation.
- Only parallel flows can be detected.

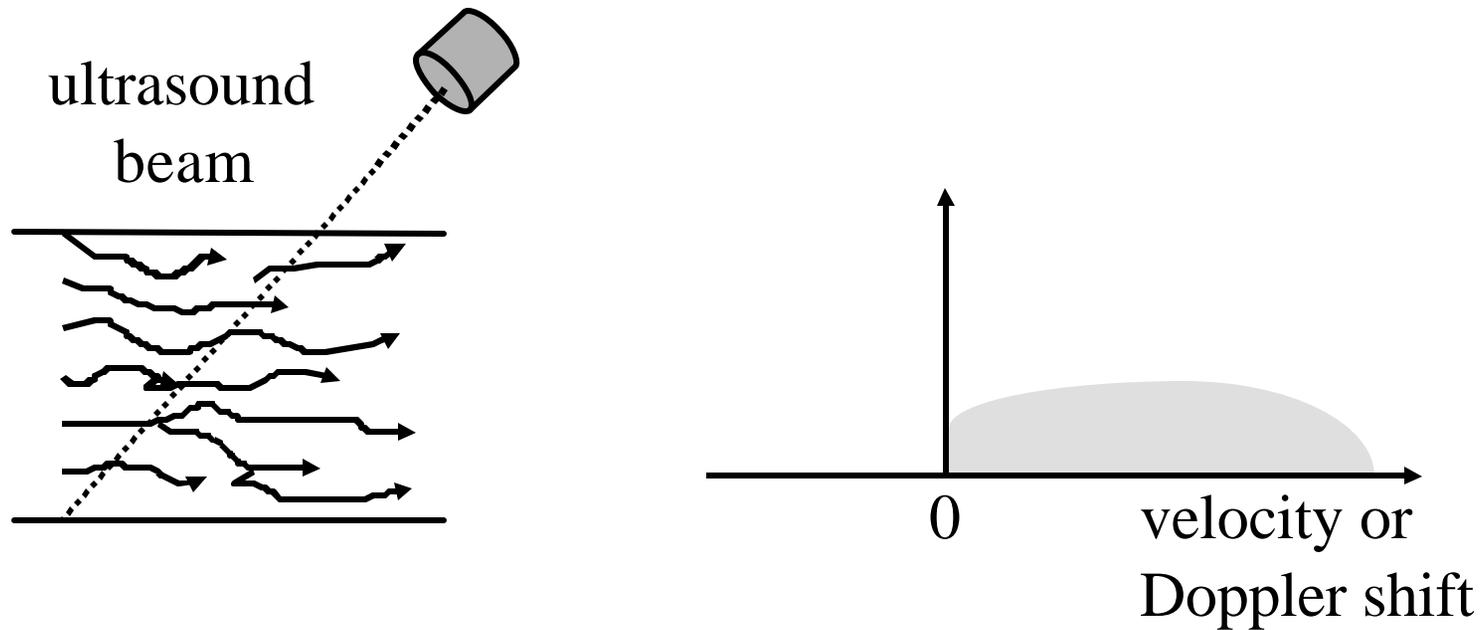

Flow Pattern vs. Velocity Profile

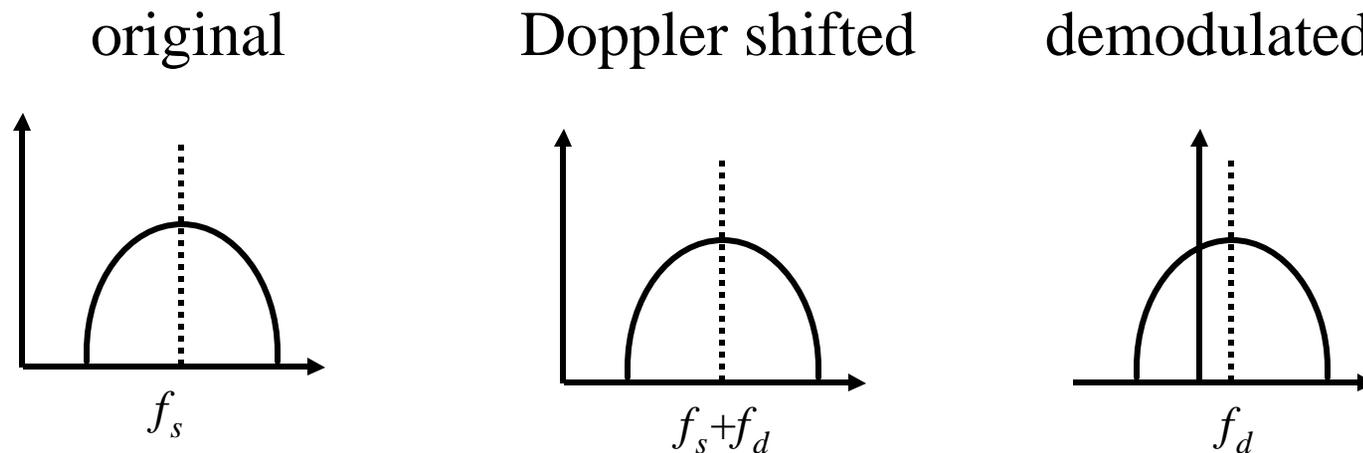

Flow Pattern vs. Velocity Profile

Flow Pattern vs. Velocity Profile

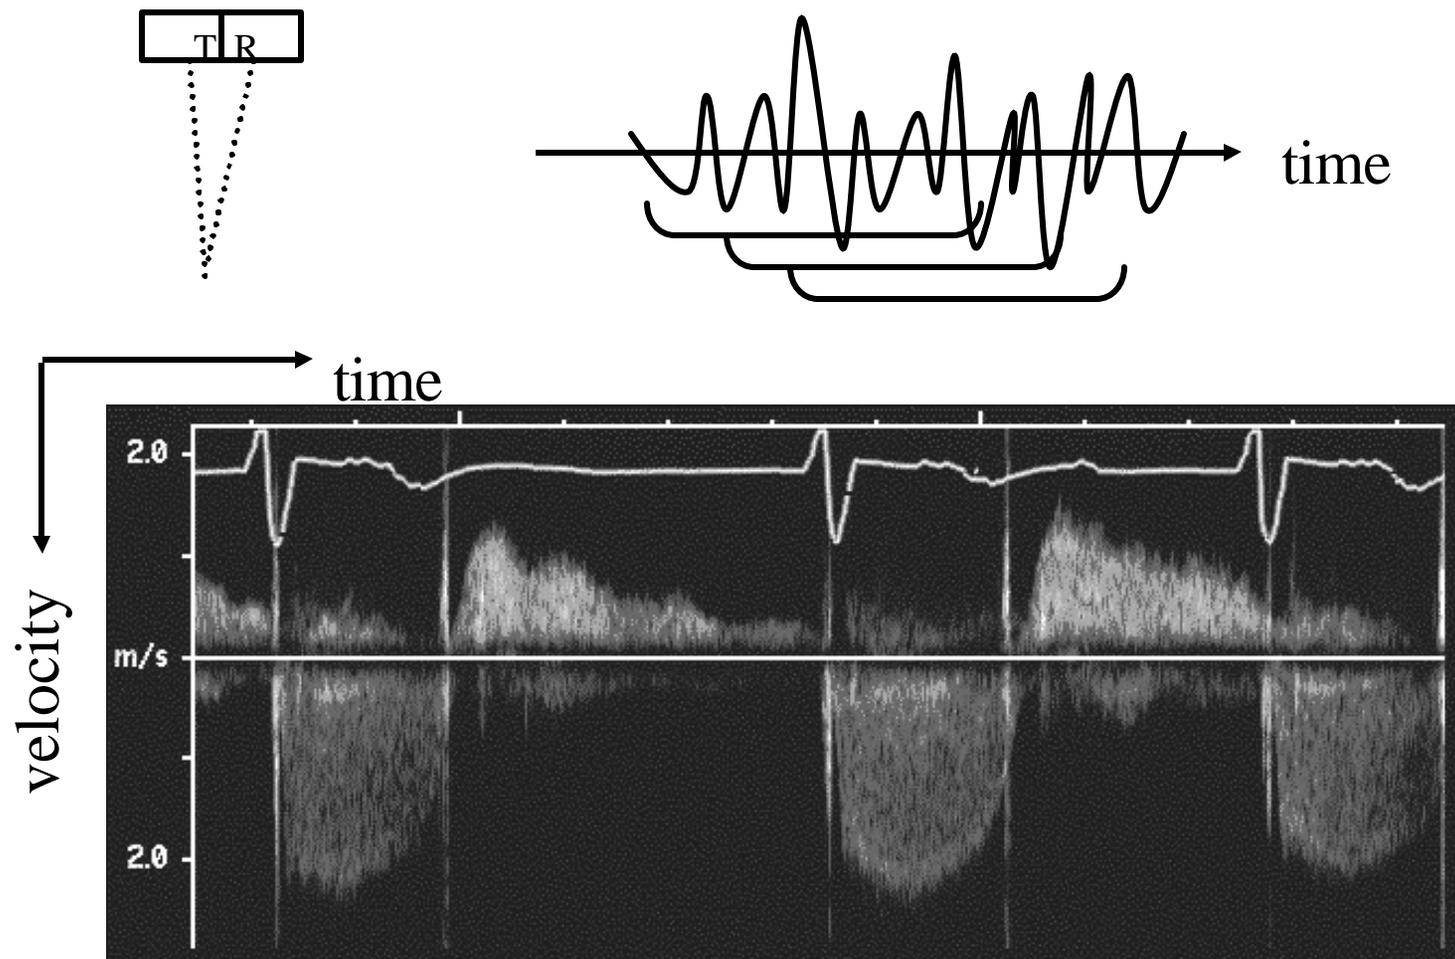

Doppler Spectrum Estimation

- Short-time Fourier transform (Spectral Doppler).
- Correlation based estimation (Color Doppler).

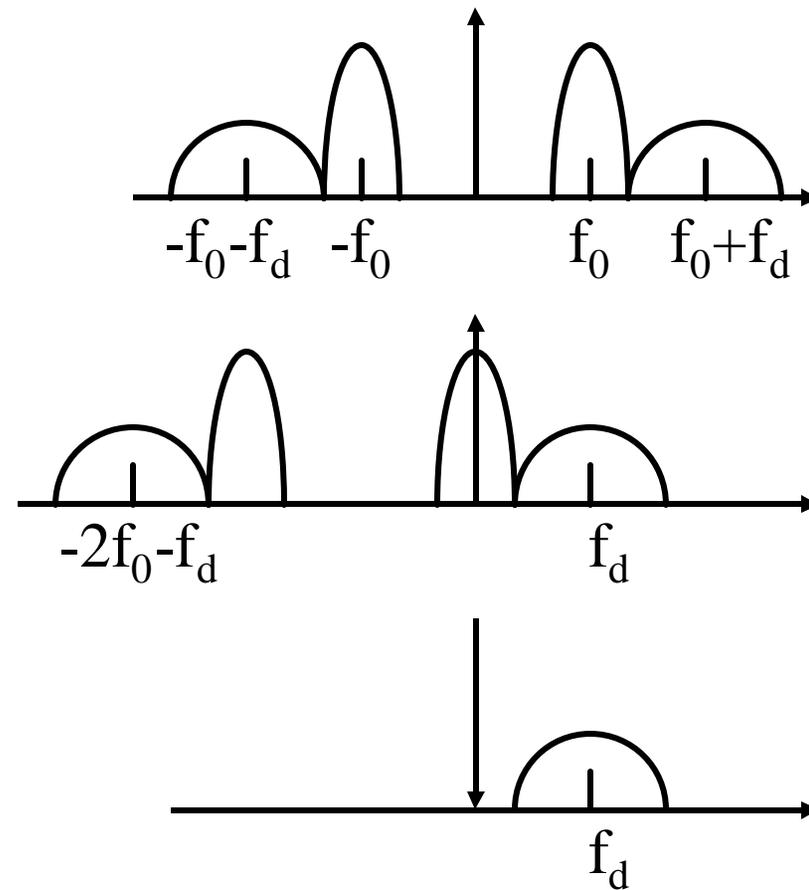

Continuous Wave (CW) Doppler

CW Doppler

- Array CW and AUX CW (half transmit, half receive).
- Mainly for Cardiology.
- Good velocity (frequency) resolution.
- No range resolution. Flows along the same direction are all detected.
- Frequency downshift due to attenuation can be ignored.

CW Doppler Processing

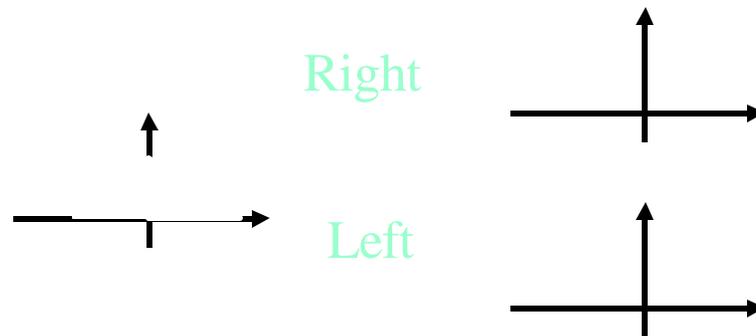

CW Doppler Processing

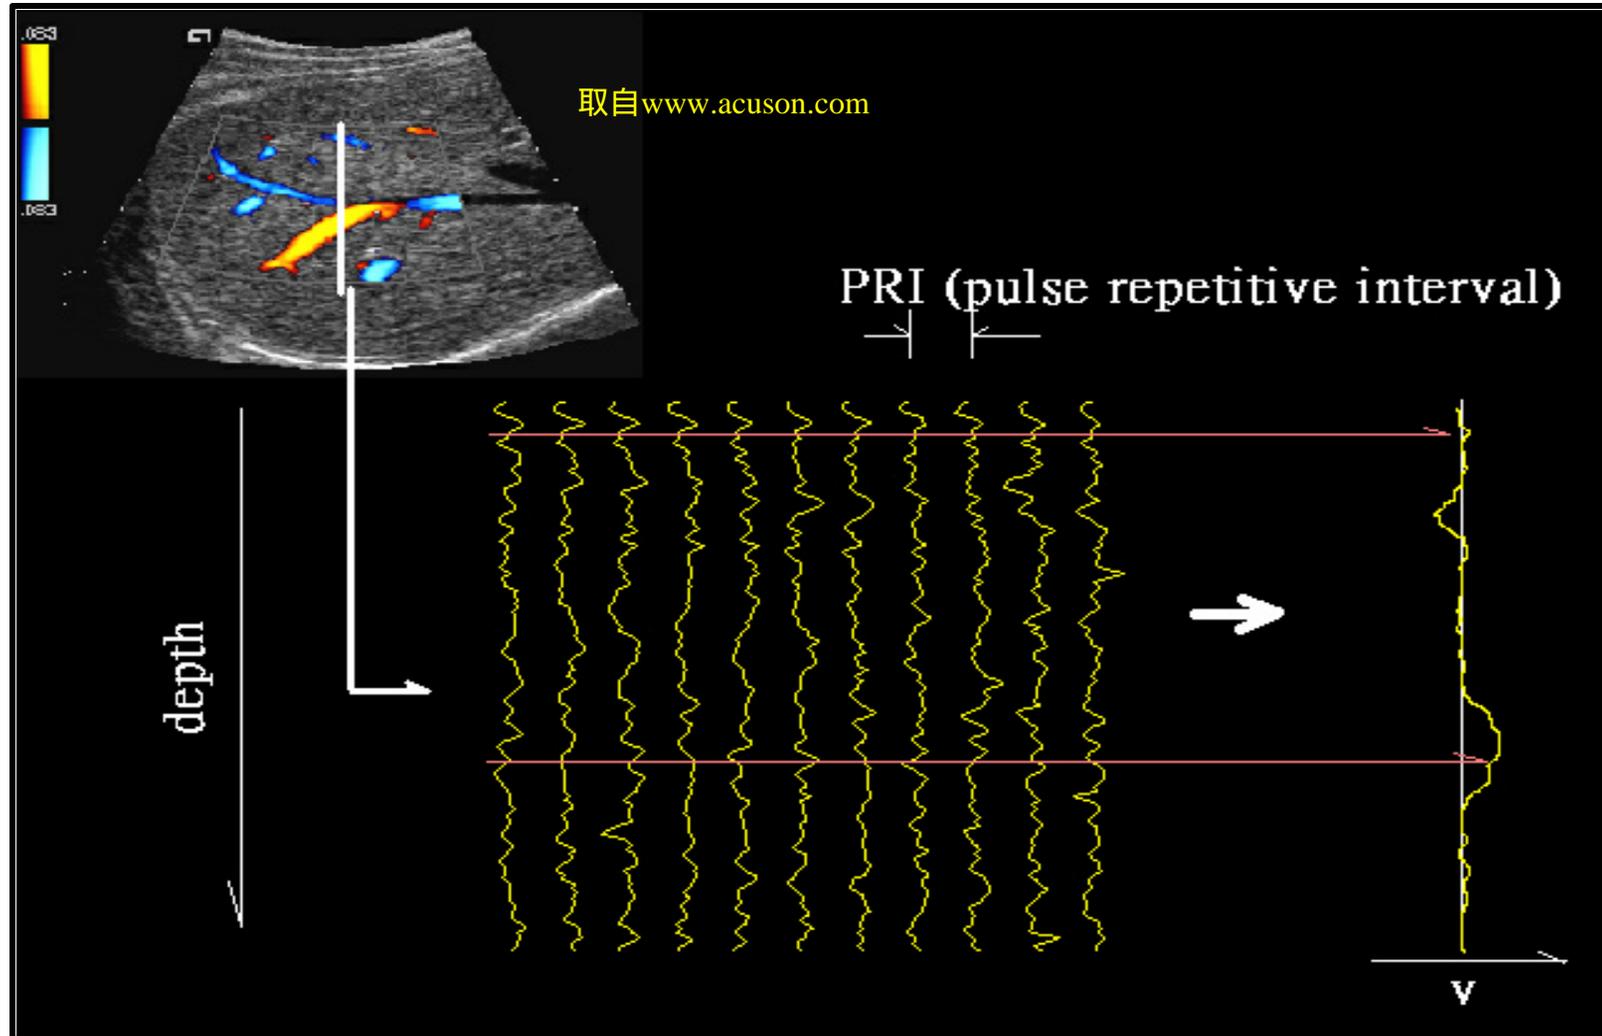

- Time-interval histogram.
- 32-128 ppt FFT.
- Mode-based spectrum estimation (AR), time-frequency analysis.
- Magnitudes are converted in dB and displayed.
- Post-processing similar to B-mode.

Audio Doppler

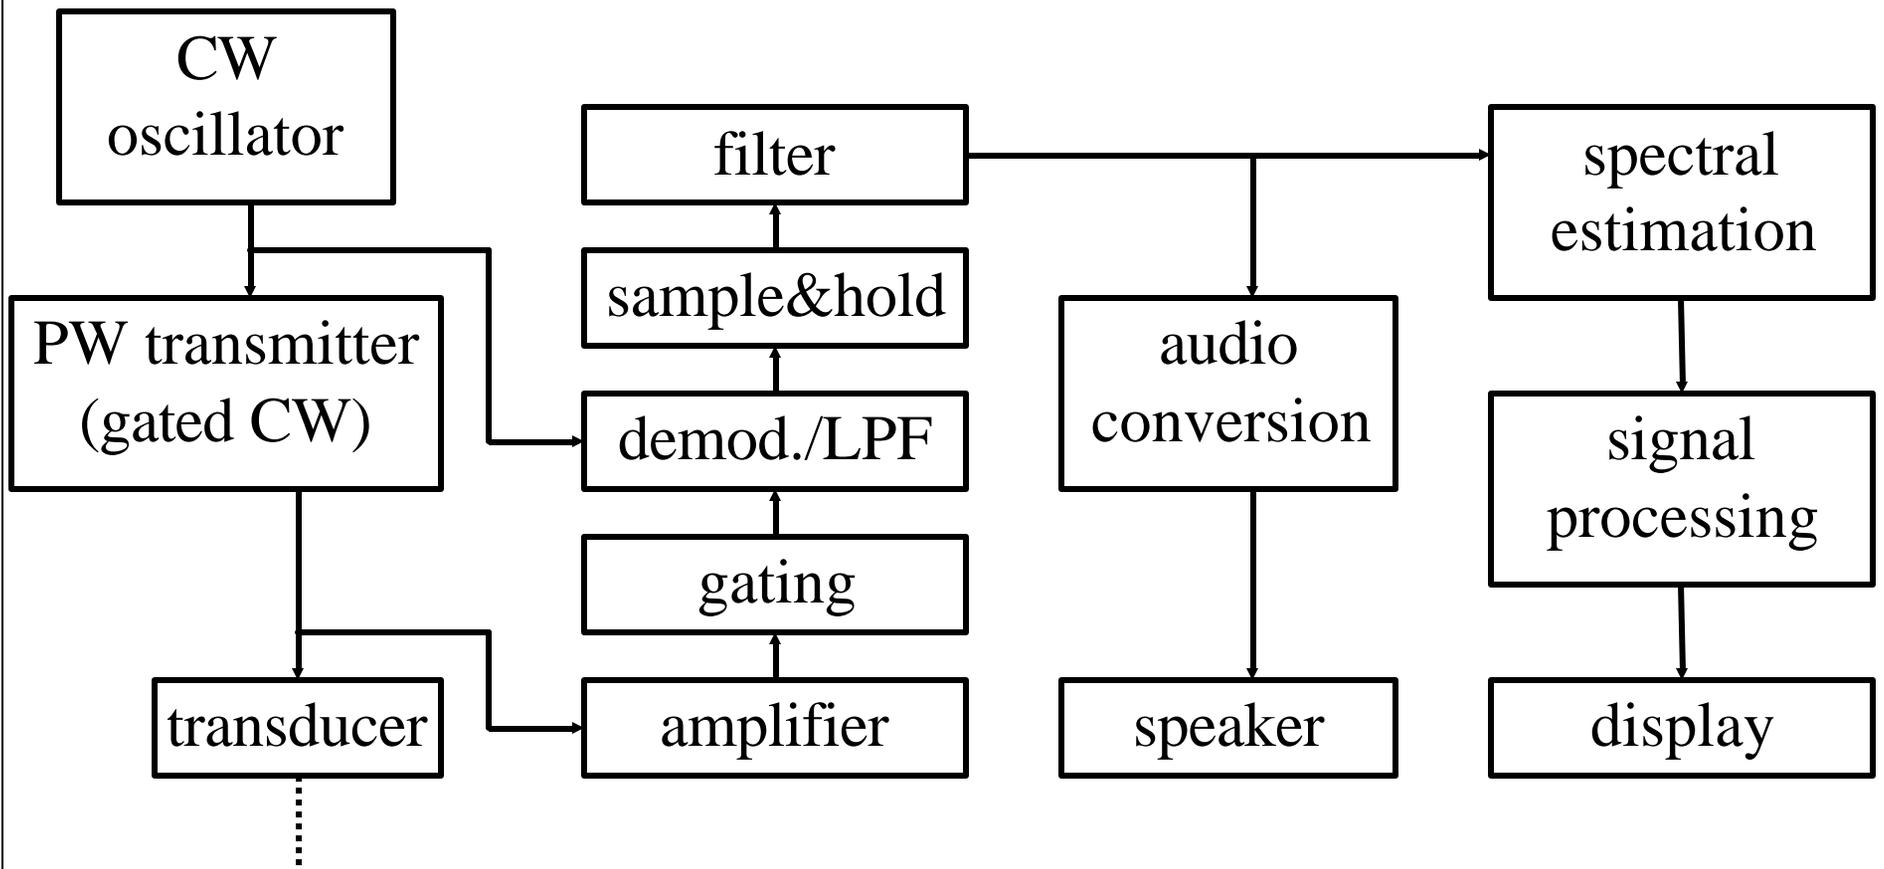

- For typical blood velocities and carrier frequencies, the Doppler shifts from blood happen to be in the human audible range (near DC to 20KHz).
- Positive shifts in one channel and negative ones in the other.
- Hilbert transform.
- Clinically useful.

Pulmonary Vein Inflow

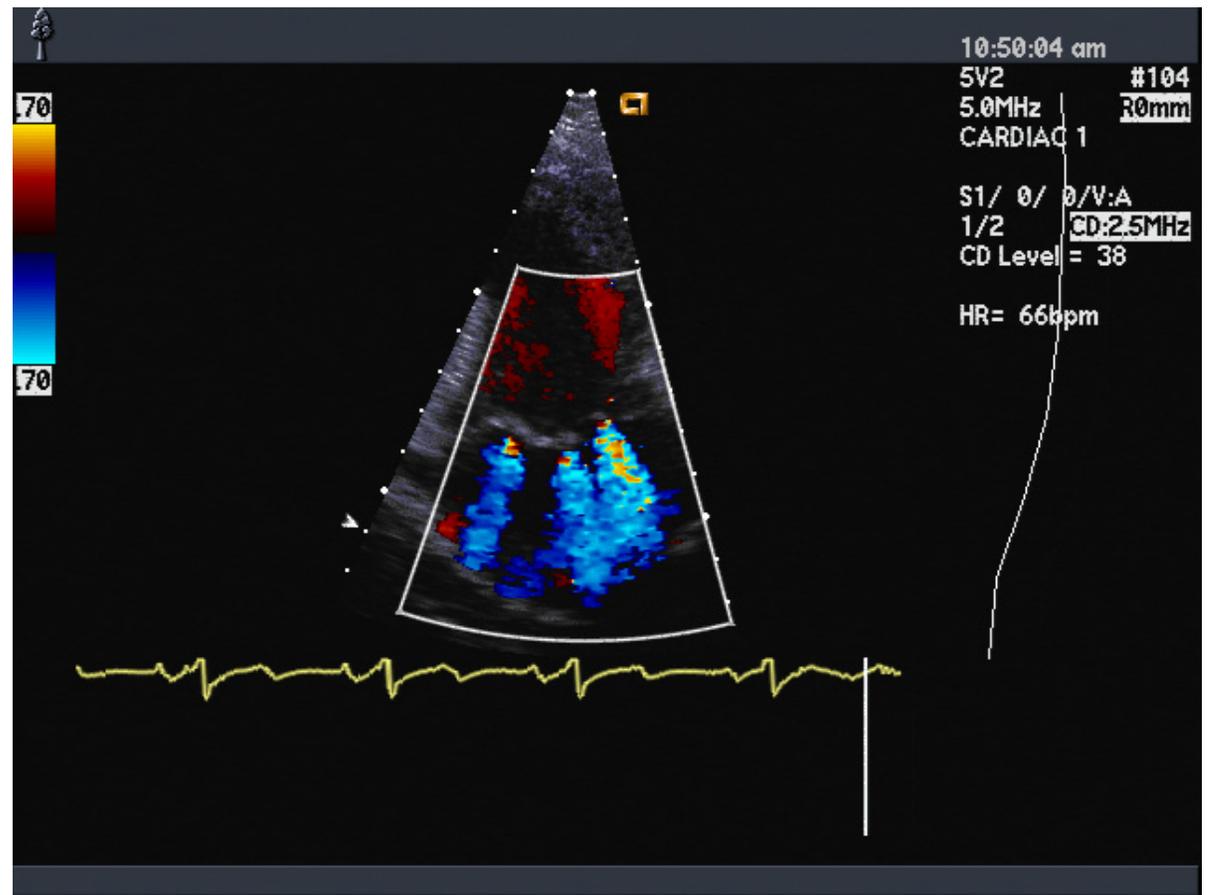

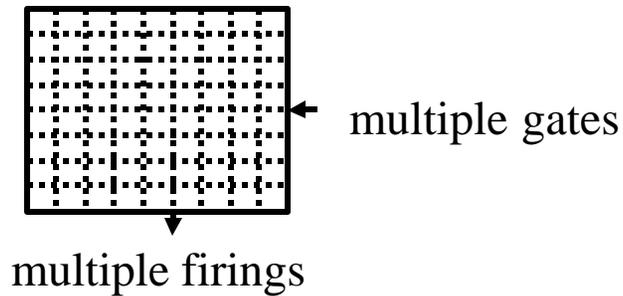

Range Ambiguity

Pulse Wave (PW) Doppler

- Pulse-echo method, similar to B-mode.
- Post-processing similar to CW.
- Adjustable range resolution (gate).
- Maximum detectable velocity is $\lambda/(4*PRI)$.
- Maximum depth is $(c*PRI)/2$.
- 32-128 point FFT.

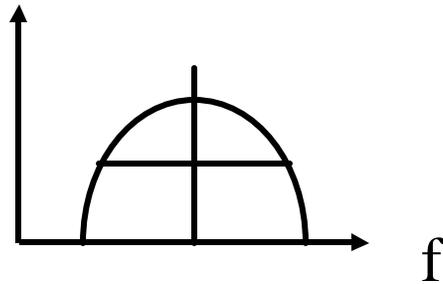

Color Doppler

Color Doppler

- Similar to B-mode, except that each line is fired multiple times (5-15).
- Correlation processing.
- Multiple range gates along each line.
- Real-time two-dimensional flow imaging.
- Poor velocity (frequency) resolution.

Color Doppler

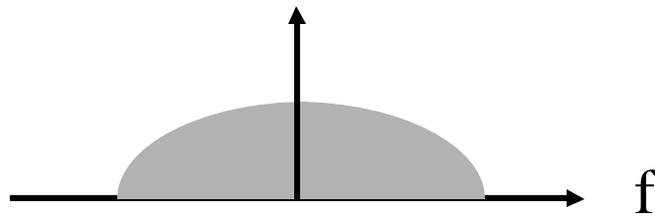

- Use efficient time domain correlation techniques to calculate flow characteristics.
- Auto-correlation of the Doppler signal.
- Commonly derived parameters are mean velocity (including directionality), variance and energy (power).

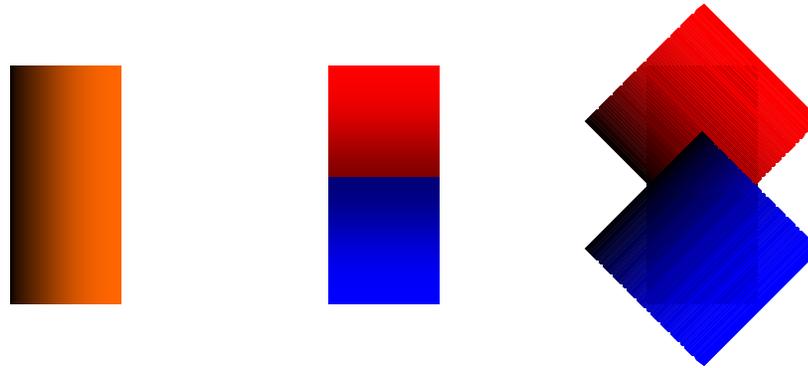

Color Doppler: Mean Velocity

Color Doppler: Variance

Color Doppler: Energy

Color Doppler

- Flow parameters are mapped into colors for display (1D or 2D).
- Choice of map affects the presentation of Color Doppler images.

Color Doppler: Signal Processing

- Significant frame rate reduction.
- Small color boxes are often used to increase frame rate.
- Sophisticated systems utilize multiple beam formation to further increase frame rate.

Doppler: Complications

- Non-trivial wall filters are required to remove interference from slow-moving objects.
- Adequate signal processing capabilities and sufficient dynamic range are necessary to detect weak flows.
- Conflicts with frame rate requirements.
- Only parallel flow is detectable.

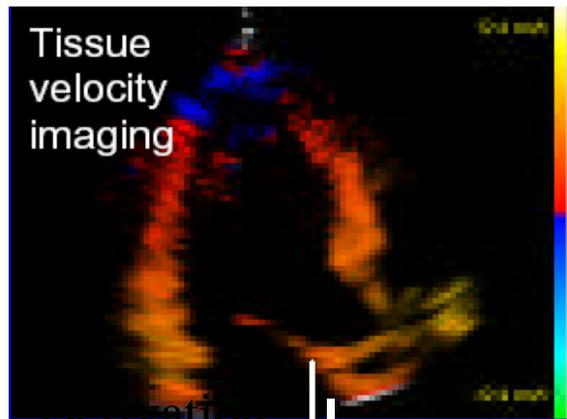

Doppler: Tissue Motion Imaging

- Doppler principles can be used to visualize cardiac motion.
- Higher signal levels allow simpler wall filters and less number of firing.
- Suitable for cardiac applications.

Doppler Tissue Imaging

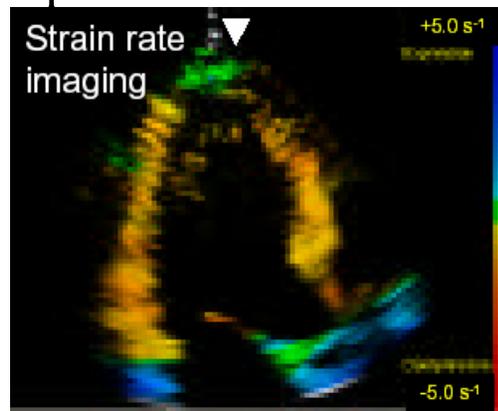

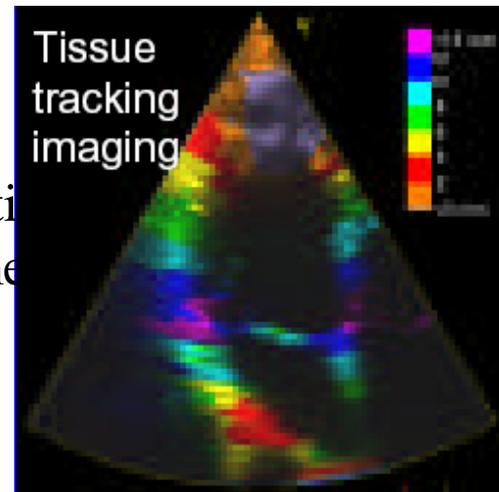

- Heart motion parameters:
 - Velocity: $v = dw/dt$.
 - Displacement w : temporal integration of v .
 - Strain rate: $r = dv/dz$.
 - Strain s : temporal integration of r .

Doppler Tissue Imaging

Ultrasonic Nonlinear Imaging-
Tissue Harmonic Imaging

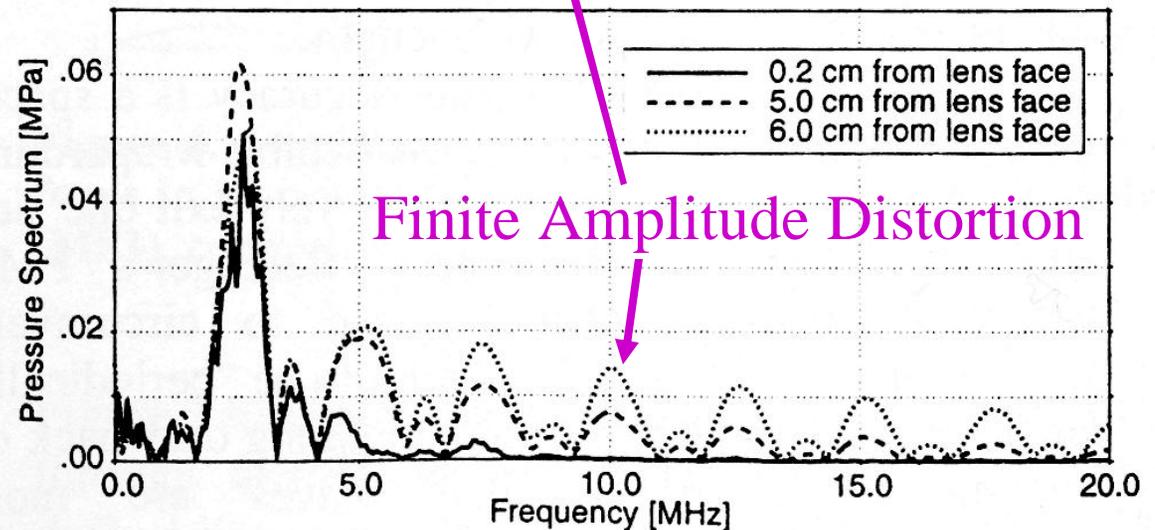

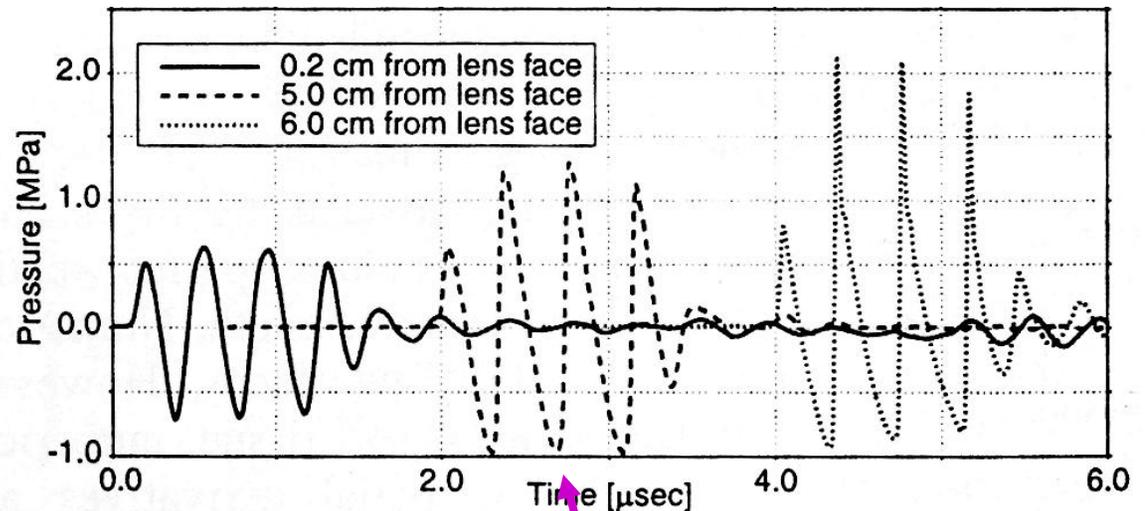

Sound Velocity and Density Change

$$v(x) = c_0 + \left(1 + \frac{B}{2A}\right)u(x)$$

Phase velocity

Nonlinearity

Particle velocity

Non-linear Parameter B/A

$$P = P_0 + \left(\frac{\mathcal{J}P}{\mathcal{J}\mathbf{r}} \right)_{s;\mathbf{r}=\mathbf{r}_0} (\mathbf{r} - \mathbf{r}_0) + \frac{1}{2} \left(\frac{\mathcal{J}^2 P}{\mathcal{J}\mathbf{r}^2} \right)_{s;\mathbf{r}=\mathbf{r}_0} (\mathbf{r} - \mathbf{r}_0)^2 + \dots$$

$$P - P_0 = A \left(\frac{\mathbf{r} - \mathbf{r}_0}{\mathbf{r}_0} \right) + \frac{B}{2} \left(\frac{\mathbf{r} - \mathbf{r}_0}{\mathbf{r}_0} \right)^2$$

- **B/A defines non-linearity of the medium.**
The larger the B/A, the higher the non-linear response.

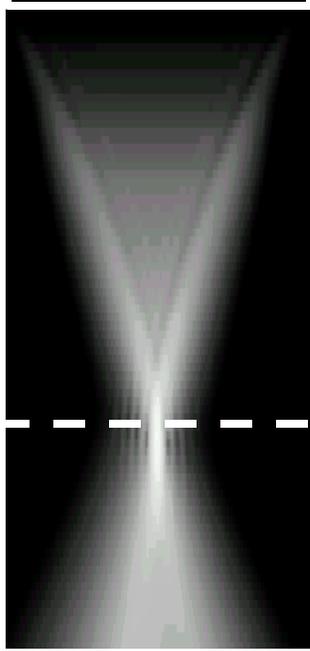

B/A Parameters: Typical Values

- Typical values:
 - Water: 5.5 ± 0.3 .
 - Liver: 7.23.
 - Fat: 10.9.
 - Muscle: 7.5.
- B/A imaging may be used for tissue characterization.

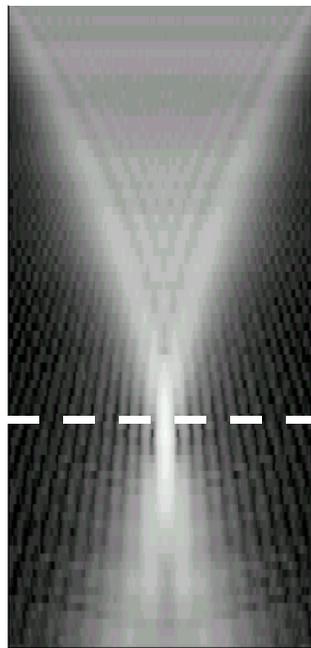

Tissue Non-linearity

- Tissue harmonics are virtually zero at the probe face. The intensity continues to increase until attenuation dominates.
- The higher the intensity is, the more tissue harmonics are generated.
- Such a mechanism automatically increase the difference between signal and acoustic noise.

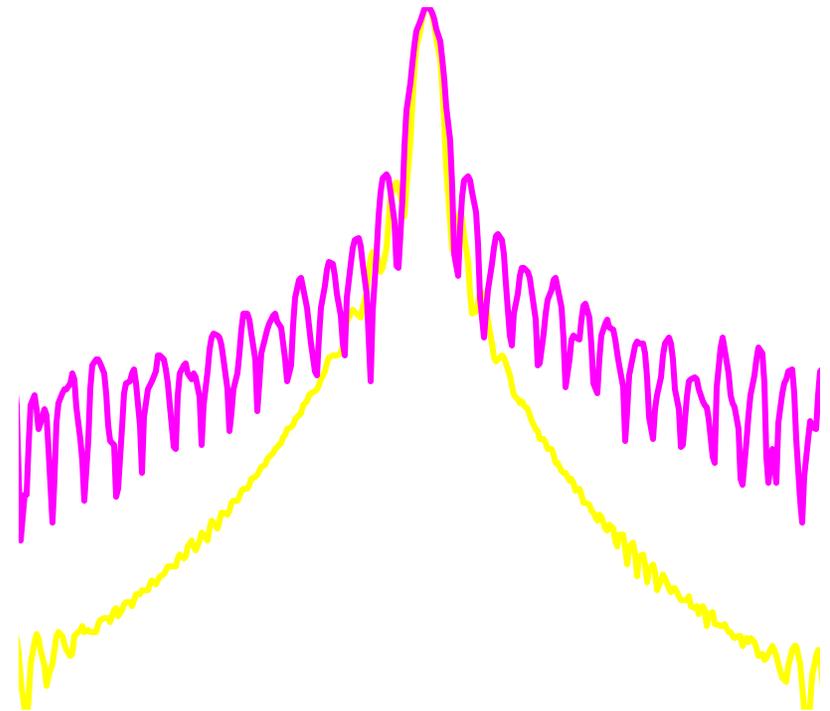

Comparison of Radiation Patterns

$2f_0$

f_0

What If We Use the Second
Harmonic Signal for Imaging?

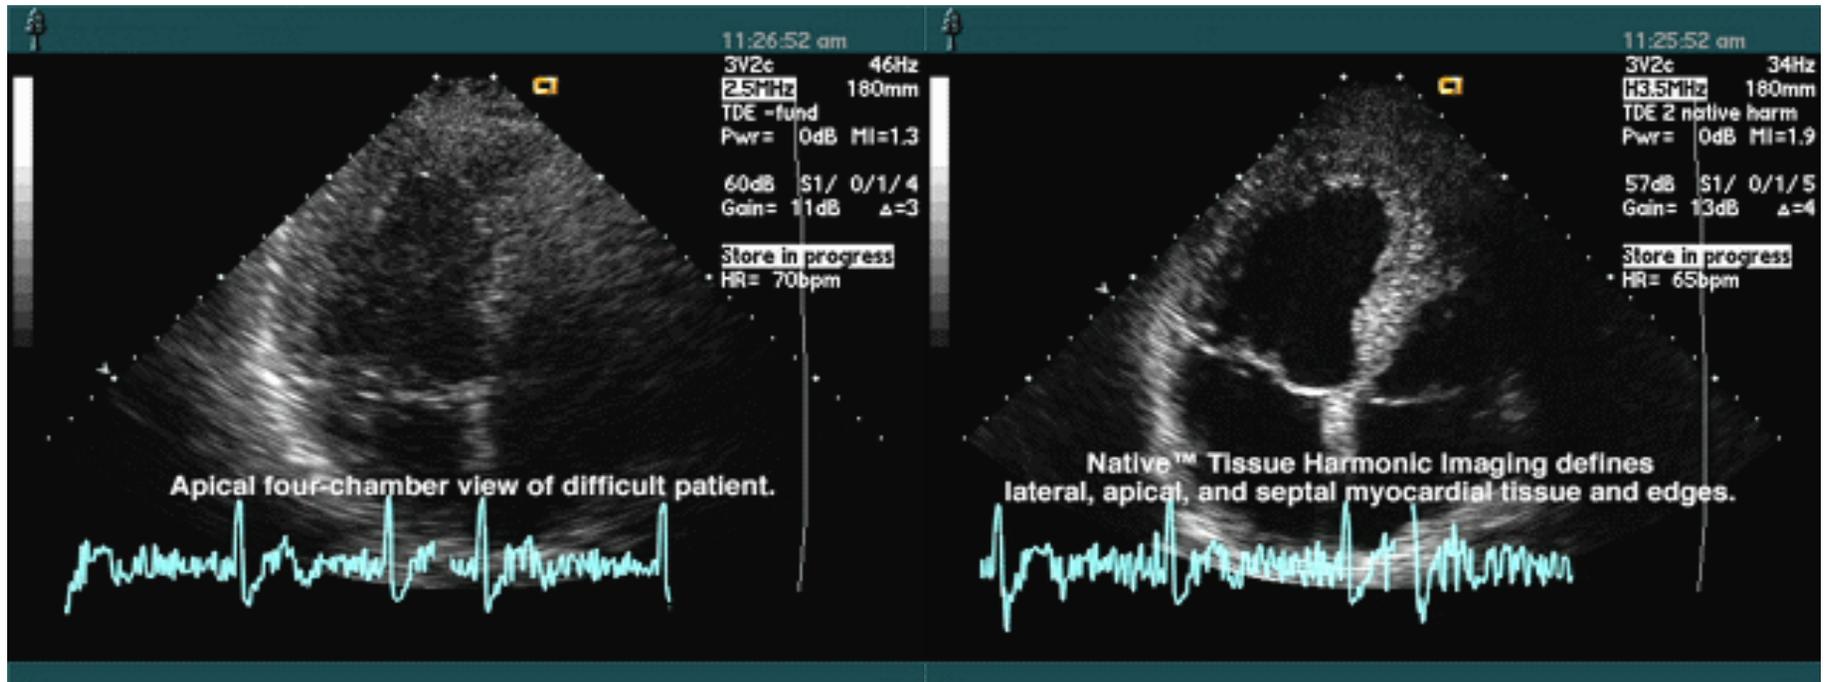

Advantages of Tissue Harmonic Imaging

- Low sidelobes.
- Better spatial resolution compared to fundamental imaging at the original frequency.
- Less affected by tissue inhomogeneities – better performance on technically difficult bodies.

Tissue Harmonic Imaging

- Performance of ultrasound has been sub-optimal on technically difficult bodies.
- Most recent new developments have bigger impact on technically satisfactory bodies.
- Poor image quality leads to uncertainty in diagnosis and costly repeat examinations.
- Tissue harmonic imaging has been successful on difficult bodies.

Reduction of Imaging Artifacts

Reduction of Imaging Artifacts
